Ms. Krista Olson
Deputy Comptroller for Budget
New York City Comptroller's Office
1 Centre Street, 8th Floor
New York, NY 10007

Re: Part II Experience Study Report – TRS and BERS

Dear Ms. Olson:

We are pleased to present the enclosed Part II Experience Study report for the five New York City Retirement Systems ("NYCRS") containing Milliman's proposed assumptions, along with an updated Milliman Experience Study Tool.

- New York City Employees' Retirement System ("NYCERS")
- Teachers' Retirement System of the City of New York ("TRS")
- Board of Education Retirement System of the City of New York ("BERS")
- New York City Police Pension Fund ("POLICE")
- New York City Fire Pension Fund ("FIRE")

This report includes Sections II and III for TRS and BERS.

The purpose of the Part II Experience Study report is to provide proposed demographic and economic assumptions to be used in the actuarial valuations performed by the Office of the Actuary (OA) for these systems based on our observations of the experience data and various discussions and meetings with Office of the Actuary. The experience includes data from 2012 – 2017 used in prior experience studies, along with updates for the 4-year period ending June 30, 2021.

This report incorporates analysis performed with the Milliman Experience Study Tool (MEST). MEST enables examination of the experience of the systems using many data elements such as age, service, plan, employee group, etc. The MEST has been further updated to display a comparison of the proposed assumptions as if they were in effect during the experience study period.

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

This work product was prepared solely for New York City Comptroller's Office for the purposes described herein and may not be appropriate to use for other purposes. Milliman does not intend to benefit and assumes no duty or liability to other parties who receive this work.

Ms. Krista Olson January 7, 2025 Page 2

In preparing this report, we relied, without audit, on information (some oral and some in writing) supplied by staffs of Office of the Comptroller and the OA. This information includes, but is not limited to, statutory provisions, employee data, administrative policies, and financial information. Since the results are dependent on the integrity of the data supplied, the results can be expected to differ if the underlying data is incomplete or missing. It should be noted that if any data or other information is inaccurate or incomplete, our calculations may need to be revised.

Milliman's work product was prepared exclusively for the New York City Office of the Comptroller, for a specific and limited purpose. It is a complex, technical analysis that requires a high-level of knowledge concerning NYCRS' operations, and is based on NYCRS' data, which Milliman has not audited. Milliman's work product is not intended to be used by, or for the benefit of, any third party for any purpose. Any third party recipient of Milliman's work product who desires professional guidance should not rely upon Milliman's work product, but should engage qualified professionals for advice appropriate to its specific needs.

On the basis of the foregoing, we hereby certify that, to the best of our knowledge and belief, this report is complete and accurate and has been prepared in accordance with generally recognized and accepted actuarial principles and practices which are consistent with the Actuarial Standards of Practice promulgated by the Actuarial Standards Board and the applicable Code of Professional Conduct, amplifying Opinions, and supporting Recommendations of the American Academy of Actuaries.

We are members of the American Academy of Actuaries and meet the Qualification Standards of the American Academy of Actuaries to render the actuarial opinion contained herein.

The consultants who worked on this assignment are actuaries. Milliman's advice is not intended to be a substitute for qualified legal or accounting counsel. The signing actuaries are independent of NYCRS. We are not aware of any relationship that would impair the objectivity of our work.

Ms. Krista Olson January 7, 2025 Page 3

We would like to thank the staffs of the Office of the Comptroller and the Office of the Actuary (OA) for their cooperation. Their prompt and courteous responses to our questions and requests for information were of valuable assistance to us and are greatly appreciated.

Respectfully submitted,

Glenn D. Bowen, FSA, EA, MAAA

Scott Porter, FSA, EA, MAAA

Executive Summary

This report summarizes the Part II Experience Study performed by Milliman of the five New York City Retirement Systems ("NYCRS"):

- Section I New York City Employees' Retirement System (NYCERS)
- Section II Teachers' Retirement System of the City of New York (TRS)
- Section III Board of Education Retirement System of the City of New York (BERS)
- Section IV New York City Police Pension Fund (POLICE)
- Section V New York City Fire Pension Fund (FIRE)

This report includes Sections II and III for TRS and BERS.

The primary purpose of the Part II Experience Study Report is to provide proposed actuarial assumptions based on the experience for the indicated systems:

- This report provides information on key pre-retirement demographic assumptions withdrawal, retirement and disability – used in the actuarial valuations performed by the OA.
- This report provides information on key salary-related actuarial assumptions rates of salary increase and overtime (not applicable for TRS and BERS).
- This report provides information on the pre-retirement and postretirement mortality assumptions used in the actuarial valuations performed by the OA.
- This report is supplemented by Excel files containing full age service tables detailing the proposed assumptions.

The experience study includes information for the 10-year period ending June 30, 2021 as provided by the OA. This includes data from 2012 – 2017 contained in the historical database along with updates for the 4-year period ending June 30, 2021 completed by Milliman.

The following is a summary of the proposed assumptions and the potential impact on plan liabilities for TRS and BERS. Milliman was not engaged to perform a replication nor determine the cost impact of the proposed assumptions. Therefore, the comments reflect our thoughts on the potential impact, but will ultimately depend on the current active membership based on analysis to be conducted by OA.

TRS

| | Summary of TRS Proposed Assum | ptions |
|-----------------------------|---|--|
| Decrement | Proposed Assumption | Potential Impact |
| Salary | Lower rates of salary increase but some service periods with higher rates. | Reducing salary increases will result in lower plan liabilities. Actual impact to be determined by OA. |
| Withdrawal | Lower rates of terminations for longer service members, although higher rates are proposed for shorter service members. | Reducing withdrawal rates results in higher plan liabilities. Actual impact to be determined by OA. |
| Retirement | Higher rates of retirement proposed at 20 or more years of service whereas lower rates are proposed for shorter service periods increasing the number of members to receive the 2% formula benefit. | Higher rates for longer service members will result in higher plan liabilities but actual impact to be determined by OA. |
| Ordinary Disability | Higher ordinary disability rates for members not eligible for the 2% benefit formula and unreduced retirement plus elimination of the assumption for those eligible. | Higher rates of ordinary disability result in higher plan liabilities plus eliminating retirement eligible members will result in higher plan liabilities. |
| Accidental Disability | Higher accidental disability rates for female members. | Increasing accidental disability rates results in higher plan liabilities. |
| Ordinary Death | No change in the assumption. | No impact on plan liabilities. |
| | Post Retirement Mortality | |
| Service Retirees | Proposing adjustments to current custom table. Higher projected annuity factors for ages until early 70s and lower for older ages. | Anticipating higher liability for active members but potentially lower liability for retirees. Actual impact to be determined by OA. |
| Disabled Retirees | Proposed assumption consistent with industry standards, decreasing projected life expectancy. | Lower life expectancies are anticipated to decrease plan liabilities. |
| Contingent Beneficiaries | Proposed assumption consistent with industry standards, decreasing projected life expectancy. | Lower life expectancies are anticipated to decrease plan liabilities. |

The actual direction of the impact of the changes to rates of salary increases, withdrawal and retirement is unknown. Changes to ordinary and accidental disability retirements will lead to higher costs. Changes to postretirement mortality tables will lead to higher costs for active members, but potentially lower costs for retirees. The net effect is probably an increase in plan liabilities, but the actual impact will be determined by OA.

BERS

| | Summary of BERS Proposed Assur | |
|-----------------------------|---|--|
| Decrement | Proposed Assumption | Potential Impact |
| Salary | Lower rates of salary increase for longer service members but higher rates for shorter service members. | Reducing salary increases will result in lower plan liabilities. Actual impact to be determined by OA. |
| Withdrawal | Lower rates of terminations for longer service members, although higher rates are proposed for shorter service members. | Reducing withdrawal rates results in higher plan liabilities. Actual impact to be determined by OA. |
| Retirement | Higher rates of retirement proposed at 20 or more years of service whereas lower rates are proposed for shorter service periods increasing the number of members to receive the 2% formula benefit. | Higher rates for longer service members will result in higher plan liabilities. |
| Ordinary Disability | Higher ordinary disability rates for members not eligible for the 2% benefit formula and unreduced retirement plus elimination of the assumption for those eligible. | Higher rates of ordinary disability result in higher plan liabilities plus eliminating retirement eligible members will result in higher plan liabilities. |
| Accidental Disability | Higher accidental disability rates. | Increasing accidental disability rates results in higher plan liabilities. |
| Ordinary Death | Higher mortality rates. | Increasing rates of mortality results in lower plan liabilities. |
| | Post Retirement Mortality | |
| Service Retirees | Proposed assumption consistent with industry standards, generally decreasing projected life expectancy. | Lower life expectancies are anticipated to decrease plan liabilities. |
| Disabled Retirees | Proposed assumption consistent with industry standards, decreasing projected life expectancy. | Lower life expectancies are anticipated to decrease plan liabilities. |
| Contingent Beneficiaries | Proposed assumption consistent with industry standards, decreasing projected life expectancy. | Lower life expectancies are anticipated to decrease plan liabilities. |

Excluding the impact of the changes to the postretirement mortality tables, we believe the changes in withdrawal, retirement, ordinary disability and accidental disability that are anticipated to increase plan liabilities will exceed the impact of the changes in rates of salary increase and ordinary death that are anticipated to decrease plan liabilities. Changes to the postretirement mortality tables are anticipated to decrease plan liabilities. The net effect is probably a decrease in plan liabilities, but the actual impact will be determined by OA.

Introduction

Part II Experience Study Introduction

Milliman's focus for Part II of the experience study is to provide proposed actuarial assumptions reflecting the experience during the 10-year study period July 1, 2011 – June 30, 2021. The experience data used in our review splits this study period into three periods:

- Prior period: July 1, 2011 June 30, 2017 (2012 2017), which includes updates made by Milliman to the historical data, primarily in 2017.
- Two-year period July 1, 2017 June 30, 2019 (2018 2019)
- Two-year period July 1, 2019 June 30, 2021 (2020 2021)

Throughout this report we refer to plan years by the end of the plan year. For example, 2012 refers to the period July 1, 2011 to June 30, 2012; 2021 refers to the period July 1, 2020 to June 30, 2021.

The proposed assumptions are based on our observations using the Milliman Experience Study Tool (MEST) which creates customized experience summaries for the chosen study periods. This report includes various graphs and charts produced by MEST.

This report focuses on key pre-retirement decrements – withdrawal, retirement and disability – and the mortality assumptions – pre-retirement and postretirement as well as the salary increase assumptions.

Selection of Actuarial Assumptions

The purpose of the actuarial valuation is to analyze the resources needed to meet the current and future obligations of the System. To provide the best estimate of the long-term funded status of the System, the actuarial valuation should be predicated on methods and assumptions that will estimate the future obligations of the System in a reasonable manner.

An actuarial valuation uses various methods and two different types of assumptions: economic and demographic. Economic assumptions are related to the general economy and its long-term impact on the System, or to the operation of the System itself. Demographic assumptions are based on the specific experience of the System's members.

Actuarial Standard of Practice (ASOP) No. 35 (please note that ASOP 35 was recently replaced by an updated version of ASOP 27 but the standard remains largely the same) governs the selection of demographic and other noneconomic assumptions for measuring pension obligations. ASOP 35 states that the actuary should use professional judgment to estimate possible future outcomes based on past experience and future expectations, and select assumptions based upon application of that professional judgment. The actuary should select reasonable demographic assumptions in light of the particular characteristics of the defined benefit plan that is the subject of the measurement. A reasonable assumption is one that is appropriate for the purpose of the measurement reflecting historical and current demographic data, that reflects the actuary's professional judgment and estimate of future experience, and that contains no significant bias, i.e., it is not significantly optimistic or pessimistic.

Choosing actuarial assumptions requires the application of actuarial judgment. It is unlikely that any two actuaries, given the same set of experience statistics, would arrive at exactly the same set of actuarial assumptions for any system as complex as NYCRS. Even allowing for minor

variations that occur because of the variability of the underlying statistics and possible data anomalies, differences among actuarial approaches will occur in analyzing trends. Some actuaries prefer to match the results of recent experience very closely in setting future assumptions, while other actuaries will use recent experience as a guide but tend to change existing assumptions gradually over time. Valid arguments can be made for either approach.

Milliman's approach in selecting proposed assumptions was to primarily reflect an assumption that was in between the current assumption and the experience. There are circumstances where the proposed assumptions may reflect the experience to a greater degree, especially if there was a change in the assumption structure. For example, the proposed retirement assumption may reflect a distinction based on years of service that was not reflected in the current assumption. In these circumstances, the proposed retirement assumption may reflect the distinction contained in the experience data to a greater extent.

Experience Analysis Process

The general procedure in a study of demographic experience is to first determine the number of participants who were exposed to the possibility of retirement, withdrawal, disability, etc. We refer to these events as decrements. The next step is to determine how many actually retired, withdrew, became disabled, etc. Dividing the number of terminations in each age and service cell by the number exposed to the possibility of termination in that cell produces the rate of decrement.

In reviewing the actual rates of decrement, we compare them to the current assumed rates used in the actuarial valuations. For this purpose, the assumed rates are those used in the most recent actuarial valuation report, the June 30, 2020 lag actuarial valuation. For example, the assumed rates of withdrawal that apply in 2016 in this analysis are based on the assumptions from the 2020 lag actuarial valuation, not the assumptions in effect in 2016.

To compare actual rates of decrement to assumed rates of decrement, we produce actual to expected ratios ("A/E" ratio). These ratios compare actual decrements (one set due to retirement, a different set due to withdrawal, a different set due to disability, etc.) with expected decrements based on the actuarial assumptions. An A/E ratio that is greater than one indicates that there were more actual decrements than expected and a ratio that is less than one indicates that there were fewer actual decrements than expected. For example, a ratio of 1.5 means that 50% more members left the plan for that cause than expected. A ratio of 0.8 means that 20% fewer members left the plan for that cause than expected.

To assist reviewers in assessing whether an assumption may need to be modified or not, we incorporated a color-coded metric to indicate how far the actual experience is from that expected:

- A green circle indicates that the experience is within 10% of that assumed, that is, the A/E ratio is in the range 0.9 − 1.1.
- An orange triangle \triangle indicates that the experience is within 50% of that assumed, but not within 10%, that is, the A/E ratio is in the range 0.5 0.9 or 1.1 to 1.5.
- A red diamond indicates that the experience is outside 50% of what was assumed, that is, the A/E ratio is smaller than 0.5 or greater than 1.5.

Please note that the color-coded symbols are meant to assist the reader to determine how far the actual experience is from that expected. Many factors are used to determine if an assumption

should be modified – reason for the deviation, credibility of the data, anticipation that experience in the future would be consistent with the prior experience, actuarial judgment, etc.

Historical Database Update

The OA provided separate historical databases with experience from 2001 to 2017 for each of the systems, the valuation files for the four-year period 2018 – 2021, detailed descriptions of the various codes contained in the data, and year by year status reconciliations or flow of lives. Milliman reviewed and updated the historical database to ensure completeness and consistency. We verified that the member valuation data provided to us was consistent with the flow of lives and updated the historical database accordingly. The historical database was imported into the MEST and we reviewed to ensure that the number of exposures and actual decrements were captured reasonably. In our review, we noticed that the 2017 status distribution in the historical database did not match the flow of lives or was inconsistent with information contained in the 2018 data. We updated the 2017 status for consistency with the 2018 data.

While the Historical Database contains the status used in each actuarial valuation, there are situations in which this status may not indicate the actual cause of decrement. Two such situations relate to disability retirements and members on leave of absence.

Disability Retirements

There are instances in which members may have applied for disability retirement, but the application had not been approved by the time the data was provided for the annual actuarial valuation. In this situation, a member status could be classified as a termination, leave of absence, etc. in one valuation file but as a disability retirement in a subsequent valuation file. In these situations, we modified the status in the historical database to reflect the eventual approval of the disability retirement. For any record who was active during the study period (2011 or later) and had a subsequent inactive status followed by a disability retirement, the years with an inactive status code were changed to the indicated disability retirement status. These adjustments are applied after any adjustments for leave of absence noted in the following section.

Please note that approvals for disability retirement that took place after June 30, 2021 for members who are indicated as terminated in the experience data are not reflected in this analysis which, consequently, underestimates the number of disability retirements, especially in the latter years of the study.

Leave of Absence

During the study period, the OA used different terminology for identifying members on leave of absence such as active off payroll, nonvested terminated, etc. In the prior experience study, records with a status code of leave of absence had this status code modified to reflect a subsequent event as if that subsequent event occurred when the leave of absence (LOA) occurred. We applied similar adjustments to the status codes in the historical database. LOA status codes exist for years 2016 and 2017 where the prior actuary did not have sufficient information to make an adjustment as well as on the valuation data added for years 2018 – 2021. The following summarizes the adjustments made when a record has a LOA code ("C"):

• If the status code in the year before the LOA code is an "F", the LOA code was changed to a termination code ("F").

- If the record has three consecutive LOA codes, then all LOA codes are changed to a termination code ("F").
- If the record has an active status within 2 years after the first LOA code, then the LOA codes are changed to a rehire status code ("B").
- If the record has an inactive status within 2 years after the first LOA code, then the LOA codes are changed to that inactive status code.

Due to this methodology, records will retain a LOA status code if:

- It first occurred in 2020 and remained a LOA status code in 2021.
- It first occurred in 2021.

Consistent with past practice, any member with a LOA status code was not included as a decrement because some of these members subsequently returned to active status. Furthermore, all remaining LOA status codes in 2020 are counted as exposures for withdrawal purposes. Therefore, all else being equal, the overall rates of termination are smaller during the two-year period 2020 – 2021 than in other years. Due to this situation, these years are primarily excluded from the analysis. We do note that the vast majority of records with a LOA status code do terminate employment (withdrawal, retire, become disabled, etc.).

Other BERS Adjustments

During our review process, there were numerous records where a death was first reflected in the 2019 actuarial valuation. After further review, OA provided actual dates of death and Milliman adjusted the status in earlier years.

Salary Adjustments

For TRS and BERS, base salary was set to the valuation data fields labeled "Salary_Total" and "ValuationSalary", respectively. No additional adjustments were required.

Pension Benefits

The amount of a member's pension is used in the retiree mortality analysis as typically members with higher pension benefits would have lower rates of mortality. Bolton was the first actuary to incorporate pension benefits in the historical database beginning with fiscal year 2015. This process is also consistent with the method used by the Society of Actuaries in producing industry-wide tables. For consistency, we utilized the same process as Bolton which reflected a member's fixed annuity, cost-of-living-increase and any variable fund amounts. The variable fund amounts are multiplied by a corresponding unit value contained in the data. If an annual pension benefit was less than \$10,000, \$10,000 was used for amount-weighting purposes.

The following table lists the fields used:

| Field | Description | Unit Value |
|---------------------|----------------------------|---------------|
| | TRS | |
| VarA_AnnuityCurrent | Variable Fund A - Employee | UnitValueVarA |
| VarB_AnnuityCurrent | Variable Fund B - Employee | UnitValueVarB |
| VarC_AnnuityCurrent | Variable Fund C - Employee | UnitValueVarC |

| VarD_AnnuityCurrent | Variable Fund D - Employee | UnitValueVarD |
|---------------------|----------------------------|---------------|
| VarE_AnnuityCurrent | Variable Fund E - Employee | UnitValueVarE |
| VarF_AnnuityCurrent | Variable Fund F - Employee | UnitValueVarF |
| VarG_AnnuityCurrent | Variable Fund G - Employee | UnitValueVarG |
| AnnuityCurrent | Fixed Annuity – Employee | N/A |
| VarA_PensionCurrent | Variable Fund A – Employer | UnitValueVarA |
| VarB_PensionCurrent | Variable Fund B – Employer | UnitValueVarB |
| VarC_PensionCurrent | Variable Fund C – Employer | UnitValueVarC |
| VarD_PensionCurrent | Variable Fund D – Employer | UnitValueVarD |
| VarE_PensionCurrent | Variable Fund E – Employer | UnitValueVarE |
| VarF_PensionCurrent | Variable Fund F – Employer | UnitValueVarF |
| VarG_PensionCurrent | Variable Fund G - Employer | UnitValueVarG |
| Pension1Current | Fixed Annuity – Employer | N/A |
| SuppAmount | Cost of Living Amounts | N/A |
| | BERS | |
| AnnPayA | Variable Fund A - Employee | UnitValueVarA |
| PenPayA | Variable Fund A – Employer | UnitValueVarA |
| LSAnnF | Fixed Annuity – Employee | N/A |
| PayAnnF | Fixed Annuity – Employer | N/A |
| PayPRF1F | Reserve Fund – Employer | N/A |
| PayAnnFR | Reserve Fund – Employee | N/A |
| AMTSUP | Cost of Living Amounts | N/A |

Exposures and Decrements

An exposure is a member who is subject to the particular contingency being studied. For example, an active member who has met the conditions for retirement is a retirement exposure. If they have not met that condition, then they are a withdrawal exposure. The following section describes the rules used to determine exposures and decrements in this analysis:

- Any record considered an active employee in the indicated actuarial valuation is considered an exposure for pre-retirement decrements. This includes status codes of "A" and "B". For withdrawal purposes, records with a LOA status code of "C" are also included as exposures.
- Members indicated as terminations during the year who do not meet the conditions for retirement are reflected in the termination decrement.
- Members indicated as retirements during the year, or members indicated as terminations who do meet the conditions for retirement, are reflected in the retirement decrement.
- Exposures for ordinary disability exclude service periods prior to the eligibility conditions. For example, if 10 years of service is required to receive an ordinary disability benefit, the exposures exclude all members prior to 10 years of service.

Age and Service Calculations

Age was determined as age nearest on July 1 based on the date of birth and the indicated valuation year. Service is based on the service field contained in each year's valuation data as imported into the Historical Database and rounded to the nearest integer.

Due to the rounding of ages and service calculations, it may appear that some members retire before they are eligible. For example, a member retires at exactly at age 57, but the rounded age may have been calculated as age 56. Another example, a member retires once they have completed 25 years of service, but the rounded service is 24. Other reasons where a record appears to have retired prior to meeting the eligibility condition could be due to purchase service, prior service or data corrections that occur at time of retirement. In these situations, the difference between a member's actual service at retirement and that on the most recent record may be greater than 1.

To capture these records in the retirement analysis, we increased a member's age by up to 1 year or service by up to 5 years. The following details the adjustments:

- 18 TRS and 100 BERS members with 4 years of service were increased to 5 years.
- 101 TRS and 123 BERS members with between 0 and 3 years of service were increased to 5 years.
- 311 TRS and 5 BERS members in the Age 55 and 25 Plan, Age 55 and 27 Plan or a physically taxing plan with 24 or 26 years of service were increased to 25 years or 27 years, respectively.
- 494 TRS and 35 BERS members (excluding Age 57 Plan) age 54 were increased to age 55.
- 109 BERS Age 57 Plan members age 56 were increased to age 57.

Confidence Intervals

Within the MEST, the user has the ability to review if the experience falls within a certain confidence interval as they can select confidence intervals at the 90th, 95th, 98th or 99th percentile levels. The 99th confidence interval will contain the widest bands as there is a 99% chance that the experience would fall within that band. The confidence interval was determined based on either the current or the proposed assumption. The confidence interval range is wider when the number of members assumed to decrement under the particular cause being studied is small and it is narrower when the number of members is larger.

In this report, the 95th confidence interval was utilized.

Milliman Experience Study Tool (MEST)

The purpose of the MEST is to analyze the experience by System using the status codes in the historical database. The MEST allows easy review of the experience by plan or other parameters for each System.

There are four primary charts in MEST for each decrement page. In addition, each of the four charts can be displayed on a service basis, age basis or year-by-year basis. Each of these pages is available for comparison to the current or the proposed assumptions. A tool bar at the top of page allows the user to select how the information is displayed.

For retirement, additional selections are available to review the experience at first eligibility or other eligibility criteria.

A walkthrough of these charts in MEST has been described below using the withdrawal decrement tab as an example.

The following charts show withdrawal decrements based on service. The chart includes the actual number of withdrawals, expected number, and the total number. The actual withdrawal rate is computed and compared to the current assumption.

| Service | Actual Withdrawals | Expected Withdrawals | Total Exposed | Actual Withdrawal Rate | Current Assumption Termination | Act | ntio /Exp erm |
|---------|-----------------------|-------------------------|------------------|------------------------------|--------------------------------------|------------|---------------------|
| _ | | | | | | | |
| 0 | 2,003 | 3,017.7 | 33,530 | 5.97% | 9.00% | | 0.66 |
| 1 | 3,302 | 4,058.2 | 50,727 | 6.51% | 8.00% | | 0.81 |

The following chart compares the actual withdrawal rate (yellow line) to the current assumption (blue line) by service (or by age or plan year depending on selection). The blue bars show the number of exposures allowing the user to identify situations where there are relatively few exposures for that bucket and that the data may not be fully credible. In addition, the dotted lines display the confidence intervals on the current assumption.

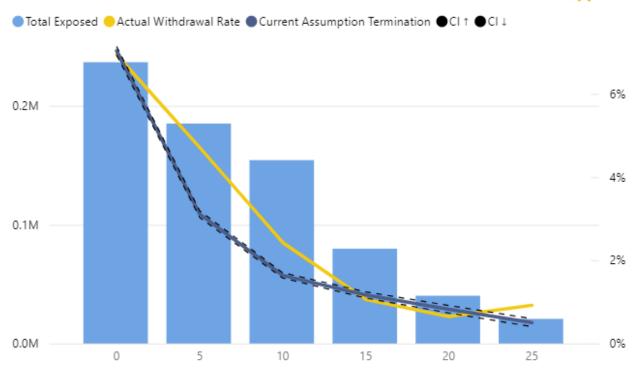

Also, this chart can be used to review the experience in 5-year service or age bins. In the chart above, the second row in the x-axis shows 0, 5, 10, etc. indicating the service bin from 0-4 years, 5-9 years, 10-14 years, etc.

The following chart shows the results based on service bins based on the current assumption.

Exposure Distribution w/ Withdrawal Rate - Actual and Expected; by Service

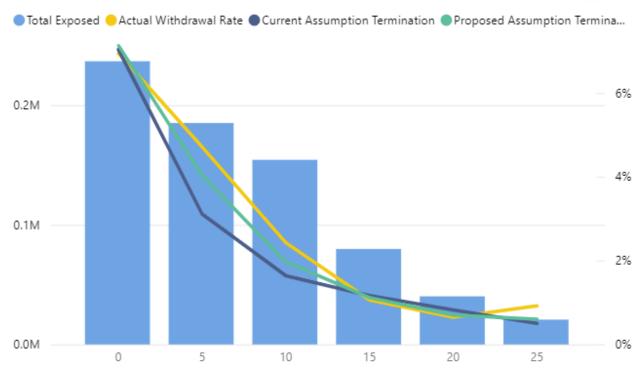

The following chart shows the results based on service bins based on the proposed assumptions (green line) in addition to the current assumption (yellow line).

Exposure Distribution w/ Withdrawal Rate - Actual and Expected; by Service

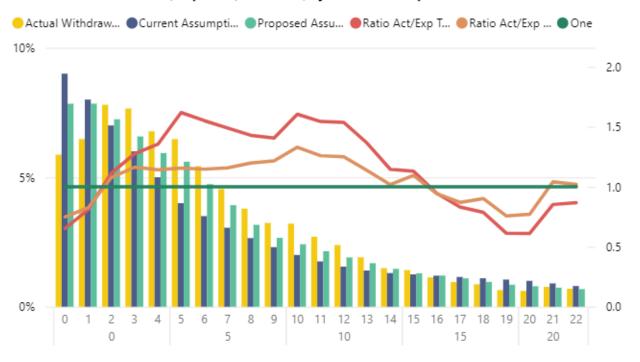

In the next chart, the A/E ratio is graphed as the red line under the current assumptions and as the orange line under the proposed assumptions, and compared to the green line which is the 1.0 baseline (meaning that the actual experience is equal to that assumed). This provides the user with a different viewpoint in comparing the results of the study. The actual withdrawal rate (yellow bars), the current assumption (blue bars) and the proposed assumption (green bars) are shown on the graph.

Withdrawal Rate - Actual, Expected, and Ratio; by Service w/Proposed

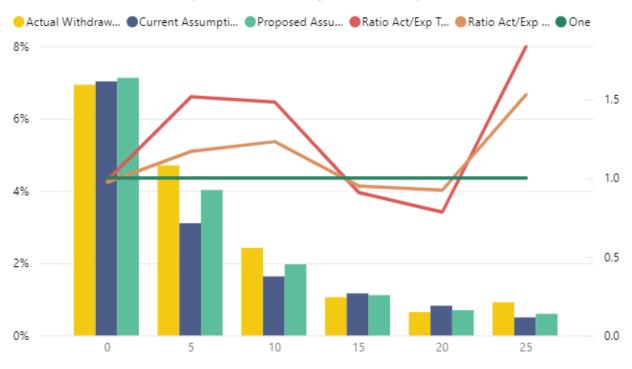

Also, this chart can be used to review the experience in 5-year service or age bins. In the chart above, the second row in the x-axis shows 0, 5, 10, etc. indicating the service bin from 0-4 years, 5-9 years, 10-14 years, etc.

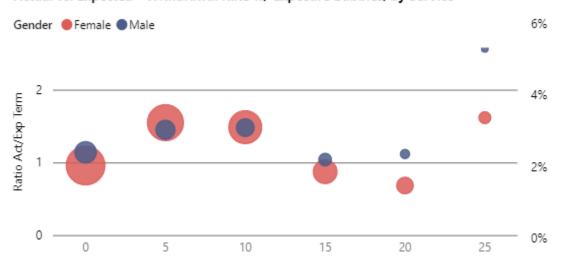

The following chart shows the results based on service bins.

Finally, a bubble chart displaying the A/E ratios by gender is shown. The size of the bubble reflects the number of exposures.

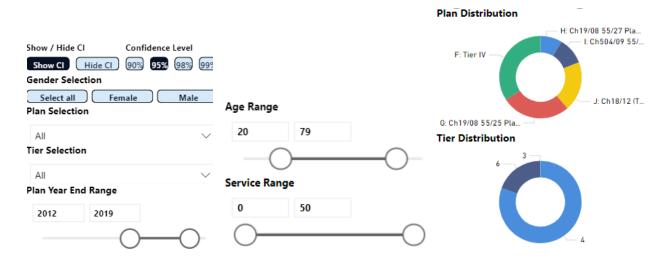

Actual vs. Expected - Withdrawal Rate w/ Exposure Bubbles; by Service

In MEST, there are various items that the user can select. Once a selection is made, the charts update in real time and the totals are based on the selections.

- Plan selections a drop-down box allows the user to select the available plan codes for that system (the options in the drop-down box depend on the selected system).
- Tier selections a drop-down box allows the user to select the available tier codes for that system.
- Gender male or female or both can be selected.
- Plan Year End Range the user can select the specific years (years selected must be consecutive). Plan year 2021 contains the experience from July 1, 2020 to June 30, 2021.
- Age and Service Ranges can be adjusted and combined with the different displays to delve deeper into the experience. For example, if a user wants to view the results by age for those who terminated with 10 or more years of service, the user can select the service range from 10 years to up to the maximum contained in the data and view results by age.
- Plan and Tier distributions provide the user with the number of exposures in each bucket (hover over the indicated cell). The user can select a specific plan or tier to see how those results differ from the totals, but we recommend using the drop-down boxes above.
- Confidence intervals the use can select to review results under the 90th, 95th, 98th, or 99th percentiles.

Section II – Teachers' Retirement System of the City of New York (TRS)

Exposures and Decrements

To set the exposures and actual decrements for TRS, the following table details the age and service conditions for unreduced retirement and reduced retirement. If a member has not met any of these conditions for the indicated plan code by year, the member is considered a withdrawal exposure. Otherwise, if the member did meet any of these conditions, they would be considered a retirement exposure. Members with a status code of termination who, nonetheless, have met the conditions for retirement, are included as actual retirements.

Using the age and service slider, a user can drill down to view the results that reflect a variety of conditions by plan code, such as reduced retirement, retirement at first eligibility, or other conditions for retirement.

| TRS Retirement Eligil | oility Chart |
|-----------------------|--------------|
|-----------------------|--------------|

| | | | Formula Bump at 20 | | d Retirement dition 1 | | d Retirement dition 2 | | d Retirement ndition |
|-----------|---------------------------------|----------|-----------------------|-------|--------------------------|-------|--------------------------|-----|----------------------|
| Plan Code | Plan Description | Mandated | YOS | Age 1 | Service 1 | Age 2 | Service 2 | Age | Service |
| Α | CPP (Plan A) | TRUE | | 55 | 5 | | | | |
| В | ISF (Plan B) | TRUE | | 55 | 5 | | | | |
| С | Modified CPP (Plan C) | TRUE | | 62 | 25 | 55 | 30 | 55 | 5 |
| D | Modified ISF (Plan D) | TRUE | | 62 | 5 | | | 55 | 5 |
| F | Tier IV | TRUE | TRUE | 62 | 5 | 55 | 30 | 55 | 5 |
| G | Ch19/08 55/25 Plan [OPTIONAL] | FALSE | TRUE | 62 | 5 | 55 | 25 | 55 | 5 |
| Н | Ch19/08 55/27 Plan [MANDATORY] | TRUE | TRUE | 62 | 5 | 55 | 27 | 55 | 5 |
| 1 | Ch504/09 55/27 Plan [MANDATORY] | TRUE | TRUE | 62 | 10 | 55 | 27 | 55 | 10 |
| J | CH18/12 (Tier 6) [MANDATORY] | TRUE | TRUE | 63 | 10 | | | 55 | 5 |
| 0 | Other | TRUE | TRUE | 62 | 5 | | | | |

Please note that exposures for Plan Codes A - D and O were excluded from the tool because there are very few of them, except when examining pre-retirement death.

For certain plans, such as the Tier 6 plans and the Ch 504/09 – 55/27 [Mandatory] plan, the vesting requirement was reduced from 10 years to 5 years due to the passage of Chapter 56, Laws of 2022. Since 10-year vesting was required during the study period, we have used 10 years in this report.

OA's retirement assumptions depend on whether a member can choose a certain retirement plan. If a member had a choice and elected the improved plan, the assumed rates of retirement are higher than those in which the member was mandated into the specific retirement plan. Higher rates of retirement apply to the indicated plan when the Mandated column is set to False. All Tier 6 plans are considered Mandated plans.

We understand that for certain elected plans (plan codes G, H and I) the OA assumes immediate reduced retirement for members who have not met the stated condition for unreduced retirement but have met the condition for early retirement under the Tier IV basic plan (age 55 and completion 5 years of service). In these situations, OA applies the rates of termination at these age/service conditions and not reduced rates of retirement. These members are included as a retirement exposure but both the current and proposed assumption reflects the reduced retirement assumption.

Rates of Salary Increase

The rates of salary increase reflect three components: 1) price inflation, 2) real wage inflation, and 3) merit increases. The combination of price inflation and real wage inflation is known as wage inflation. The current wage inflation is 3%, which reflects a price inflation assumption of 2.5% and 0.5% real wage inflation.

Based on the 2024 and 2023 OASDI Trustees report issued by Social Security, wage inflation from 2012 to 2020 had a cumulative compound average of 2.93%. Including the rate for 2021 of 9.04%, the average increased to 3.53%. However, in our analysis of the experience, we did not notice any large increases in wages during 2021. This is typical with government sector employees with union affiliations where salary increases are specified in contracts negotiated for a 3- to 5-year period. Thus, wage increases for these employees may not adjust as quickly as for other employment sectors included in the Social Security Trustees report.

For purposes of our analysis, we believe the 3% current wage inflation is representative of the actual experience during the study period. While inflation has been higher since 2021, we propose no changes to the inflation assumption of 2.5% and wage inflation assumptions of 3%. Therefore, we have developed proposed salary increases based on total salary increases during the indicated period. The merit portion is equal to the total less the 3% wage inflation.

For purposes of salary increases only members with a status code of A in consecutive years are included. Members with a LOA status code are excluded.

Although salary increases for government employees may respond less quickly to changes in inflation, using salary experience from many years in the past may not necessarily be indicative of future salary increases as they may not include changes negotiated in union contracts such as general increases, longevity payments, or other salary items. We reviewed the salary increases by year and determined what we believe was the most reasonable period to compare to the current assumption and develop proposed assumptions.

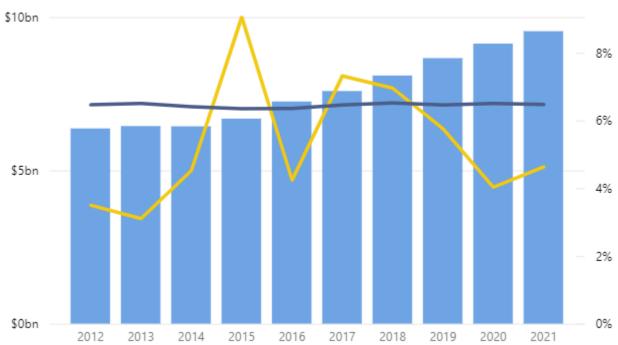

Section II - TRS

Salary

The following chart shows the experience by year for the age range 25 to 59 and for the service range 0 to 34.

We know that there was an agreement between New York City and the United Federation of Teachers (UFT) in June 2014, which we believe would have provided a one-time impact to salary increases in 2015 and a subsequent decrease in 2016. Therefore, for TRS, we focused on the 5year period from 2017 – 2021.

The current assumed rates of salary increases vary by service. The proposed assumption also varies by service. Overall, lower rates of salary increases are proposed.

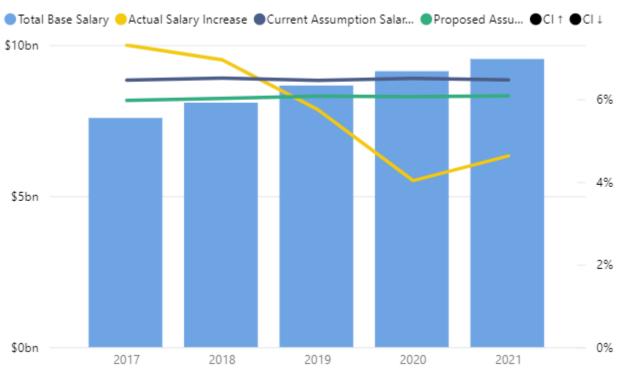

The following table shows the experience for salary increases by year, for the age range (25 to 59), and for the service range (0 to 34) from 2017 to 2021. The actual rate of salary increases averaged 5.64% whereas the overall expected rate of increase averaged 6.48% based on the current assumptions and 6.05% based on the proposed assumptions.

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

29

Milliman Section II – TRS

Salary

This chart shows the results by service for the service range 0 to 5 years, which decreased the assumed rate of salary increases from 9.39% to 8.28% as compared to the actual rate of 7.26%. This resulted in an increase in the A/E ratio from 0.77 to 0.88 for ages 25 to 59.

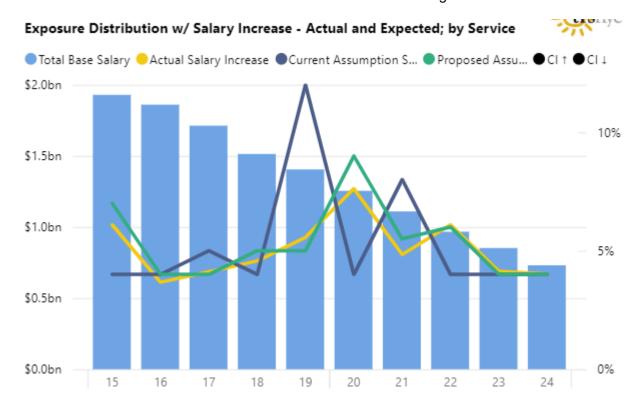

Milliman Section II – TRS Salary

This chart shows the results by year for the service range 6 to 14 years, which decreased the assumed rate of salary increases from 5.95% to 5.47% as compared to the actual rate of 5.33%. This resulted in an increase in the A/E ratio from 0.90 to 0.97 for ages 25 to 59.

Salary

This chart shows the results by service for the service range 15 to 24 years, which increased the assumed rate of salary increases from 5.30% to 5.39% as compared to the actual rate of 5.07%. This resulted in a decrease in the A/E ratio from 0.96 to 0.94 for ages 25 to 59.

Milliman

Salary

This chart shows the results by service for the service range 25 to 34 years, which decreased the assumed rate of salary increases from 4.00% to 3.93% as compared to the actual rate of 3.96%. This resulted in an increase in the A/E ratio from 0.99 to 1.01 for ages 25 to 59.

Summary

In total, the proposed rates of salary increases are lower than the current assumptions, although there are some services periods where higher rates are proposed. We would anticipate that this would decrease plan liabilities. The actual impact will depend on the demographics of the active membership.

 $^{^{\}rm 1}$ Salary increase is the general wage increase of 3% plus the merit increase

Withdrawal

The current withdrawal assumption varies by service. The proposed assumption varies by age in addition to service. Overall, this results in an increase in the assumed rates of withdrawal, especially at 15 or fewer years of service with slightly lower assumed rates of withdrawal at higher years of service.

The analysis reflected years from 2012 - 2019 as the rate of termination during 2020 and 2021 may be artificially low due to members with a LOA status code. A record with a LOA status code is included as an exposure and not a decrement.

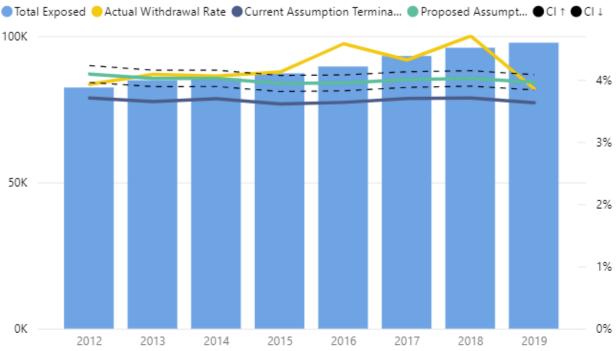

The following table shows the experience for withdrawal by year, for the age range (20 to 59), and for the service range (0 to 29). The actual rate of withdrawal averaged 4.21% whereas the overall expected rate of withdrawal averaged 3.67% based on the current assumptions and 4.00% based on the proposed assumptions.

| Plan | Actual | Expected | Total | Actual | Current | Ratio |

Withdrawal Rate - Actual, Expected, and Ratio; by Year

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

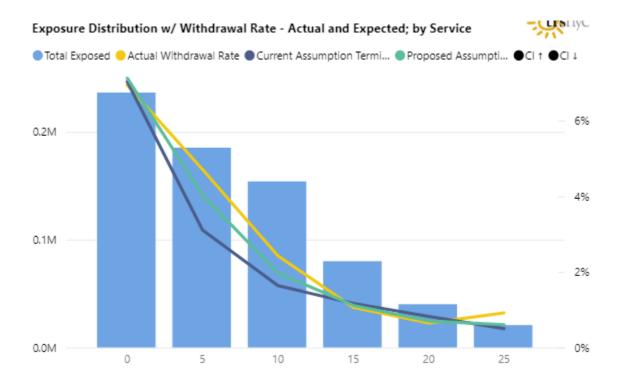

The following charts show the experience by service (0 to 29 years) in the experience study period first compared to the current assumption and then to the proposed assumption. This resulted in a decrease in the A/E ratio from 1.15 to 1.05 for ages 20 to 59. For ages 20 to 39, the A/E ratio decreased from 1.33 to 1.12 and for ages 40 to 59, the A/E ratio increased from 0.82 to 0.90.

Milliman

Withdrawal Rate - Actual, Expected, and Ratio; by Service w/Proposed

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

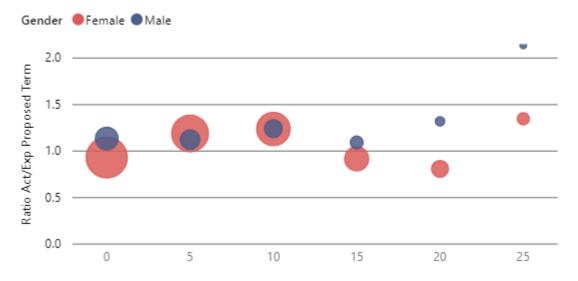

Withdrawal

Withdrawal

Milliman

The following chart shows the actual experience by gender versus the proposed assumption. Since the experience did not vary by gender significantly, a unisex table is proposed.

Actual vs. Expected - Withdrawal Proposed w/ Exposure Bubbles; by Service

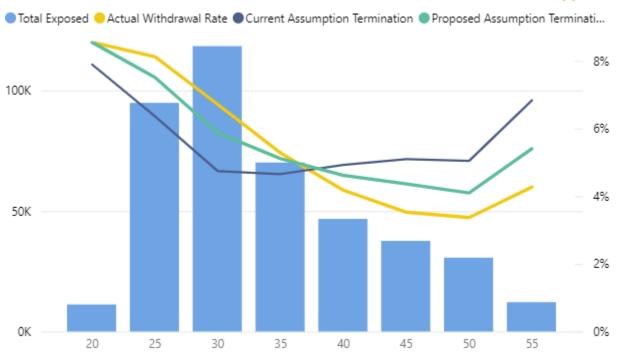

The proposed assumption varies by age in addition to service as we observed lower rates of withdrawal for older members at the same service periods. The following charts show the results by age over 10-year service periods.

Withdrawal

This chart shows the results by age for the service range 0 to 9 years, which increased the assumed rate of withdrawal from 5.31% to 5.77% as compared to the actual rate of 5.96%. This resulted in a decrease in the A/E ratio from 1.12 to 1.03 for ages 20 to 59. For ages 20 to 39, the A/E ratio decreased from 1.29 to 1.09 and for ages 40 to 59, the A/E ratio increased from 0.73 to 0.85.

Exposure Distribution w/ Withdrawal Rate - Actual and Expected; by Age

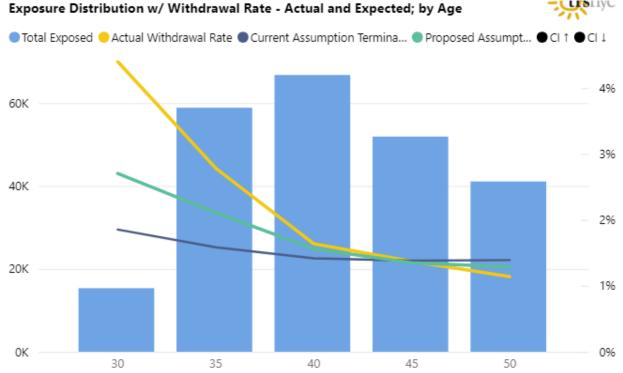

Milliman

Withdrawal

This chart shows the results by age for the service range 10 to 19 years, which increased the assumed rate of withdrawal from 1.47% to 1.68% as compared to the actual rate of 1.96%. This resulted in a decrease in the A/E ratio from 1.33 to 1.17 for ages 30 to 59. For ages 30 to 39, the A/E ratio decreased from 1.90 to 1.40 and for ages 40 to 59, the A/E ratio decreased from 1.02 to 1.00.

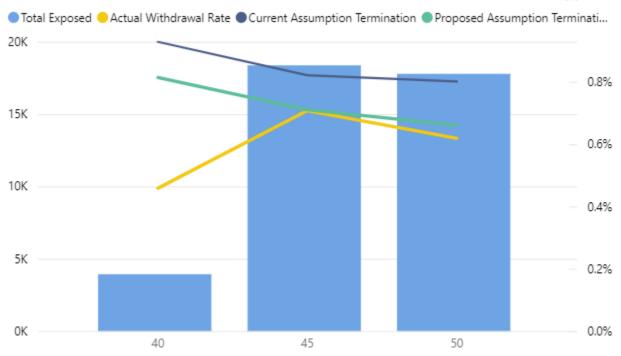

Section II – TRS Withdrawal

This chart shows the results by age for the service range 20 to 24 years, which decreased the assumed rate of withdrawal from 0.82% to 0.70% as compared to the actual rate of 0.64%. This resulted in an increase in the A/E ratio from 0.78 to 0.92 for ages 40 to 54.

Exposure Distribution w/ Withdrawal Rate - Actual and Expected; by Age

Summary

Milliman

In total, the proposed rates of withdrawal have increased the anticipated number of terminations. Typically, higher rates of withdrawal will result in a decrease in plan liabilities. However, lower assumptions are proposed for longer service members and older members increasing plan liabilities for these members. The actual impact will depend on the demographics of the active membership.

 $^{^{3}}$ Applies to ages 54 and older

Retirement

The current retirement assumption varies by age and eligibility for unreduced retirement with higher rates occurring at first eligibility. Furthermore, higher rates of retirement are assumed for members who had the option to elect an improved program. The proposed assumption varies by service in addition to these elements. Primarily lower rates of retirement are assumed prior to 20 or 25 years of service with even lower rates prior to 10 years of service.

Lower rates of retirement are proposed for members with less than 10 years of service since these members are not eligible for retiree health benefits. Higher rates of retirement are proposed for members with at least 20 years of service or 25 years of service for the improved plan members to reflect the higher benefit accrual rate.

The analysis reflected years from 2016 - 2021 as an agreement between New York City and the United Federation of Teachers (UFT) in June 2014 impacted the experience during 2014 and 2015. Please refer to our Part I Experience Study report for further discussion.

Since Tier 6 became effective on April 1, 2012, and required 10 years of service for vesting, there is little to no retirement experience associated with these plans. Chapter 56 Laws of 2022 changed the vesting requirements for the Tier 6 plans and the Ch 504/09 – 55/27 [Mandatory]) plan to five years of service. Since the vesting requirement was 10 years during the study period, we used the 10-year requirement in this report. The proposed tables reflect adjustments to apply to the Tier 6 plans.

The following table shows the experience for retirement by year, for the age range (55 to 79), and for the service range (5 to 39) for all plans and all types of retirement. The actual rate of retirement averaged 12.65% whereas the overall expected rate of retirement averaged 13.82% based on the current assumptions and 12.90% based on the proposed assumptions.

Retirement Rate - Actual, Expected, and Ratio; by Year

Analysis

We will review the retirement experience split by three plan codes:

- 1. Tier IV (plan code F) normal retirement at age 62 with reduced retirement benefits at age 55 using mandated plan retirement rates. No reduction occurs once a member accrues at least 30 years of service.
- 2. Chapter 19 55/25 Plan (Plan Code G) normal retirement is age 55 with 25 years of service using elected improved plan retirement rates.
- 3. Chapter 19 and Chapter 504 55/27 Plan (Plan Codes H and I) normal retirement is age 55 with 27 years of service using mandated plan retirement rates.
 - a. Chapter 504 allows reduced retirement at age 55 and requires 10 years of service.

Retirement

Basic Tier IV Plan (Plan F)

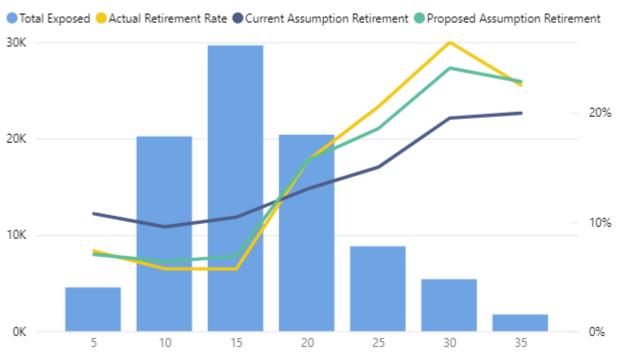

The following table shows the experience of Basic Tier IV Plan by service based on the age range (55 to 79) and service range (5 to 39) for the period 2016-2021 for all types of retirement. The actual rate of retirement averaged 11.01% whereas the overall expected rate of retirement averaged 12.01% based on the current assumptions and 11.21% based on the proposed assumptions. This resulted in an increase in the A/E ratio from 0.92 to 0.98.

Exposure Distribution w/ Retirement Rate - Actual and Expected; by Age

Milliman

Retirement Rate - Actual, Expected, and Ratio; by Age

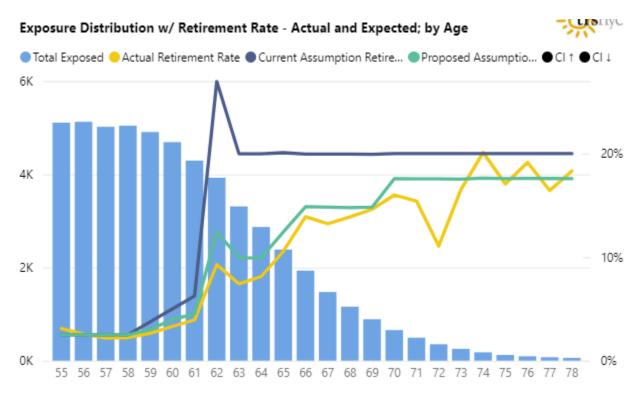

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

55

Milliman Section II – TRS

Retirement

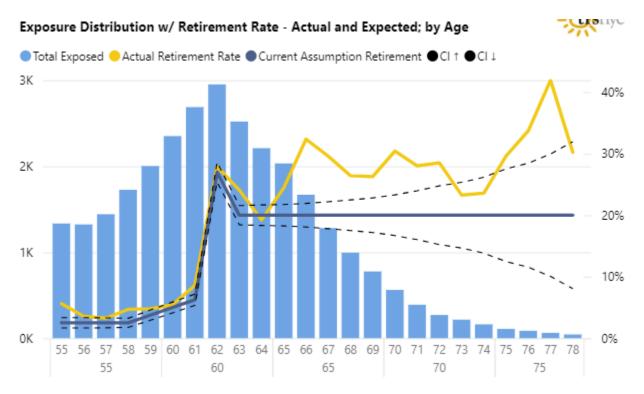

This chart shows the results by age for the service range 5 to 19 years, which decreased the assumed rate of retirement from 10.14% to 6.71% as compared to the actual rate of 5.85%. This resulted in an increase in the A/E ratio from 0.58 to 0.87 for ages 55 to 79. For early retirement ages 55 to 61, the A/E ratio increased from 0.81 to 0.93 and for normal retirement ages 62 to 79, the A/E ratio increased from 0.51 to 0.85.

Milliman Section II - TRS

Retirement

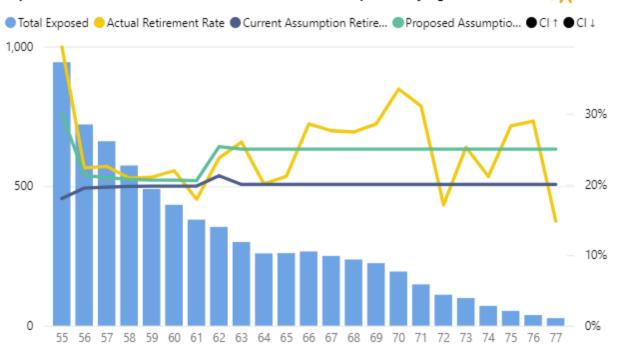

This chart shows the results by age for the service range 20 to 29 years, which increased the assumed rate of retirement from 13.63% to 16.53% as compared to the actual rate of 17.10%. This resulted in a decrease in the A/E ratio from 1.25 to 1.03 for ages 55 to 79. For early retirement ages 55 to 61, the A/E ratio decreased from 1.39 to 1.07 and for normal retirement ages 62 to 79, the A/E ratio decreased from 1.23 to 1.03.

Milliman Section II – TRS Retirement

This chart shows the results by age for the service range 30 to 39 years, which increased the assumed rate of retirement from 19.64% to 23.78% as compared to the actual rate of 25.51%. This resulted in a decrease in the A/E ratio from 1.30 to 1.07 for unreduced retirement ages 55 to 79.

Exposure Distribution w/ Retirement Rate - Actual and Expected; by Age

Age 55 and 25 Plan (Plan G)

The following table shows the experience of the Age 55 and 25 Plan by service based on the age range (55 to 69) and service range (10 to 39) for the period 2016 - 2021 for all types of retirement. The actual rate of retirement averaged 18.75% whereas the overall expected rate of retirement averaged 20.10% based on the current assumptions and 19.10% based on the proposed assumptions.

Milliman Section II – TRS Retirement

Milliman Section II – TRS

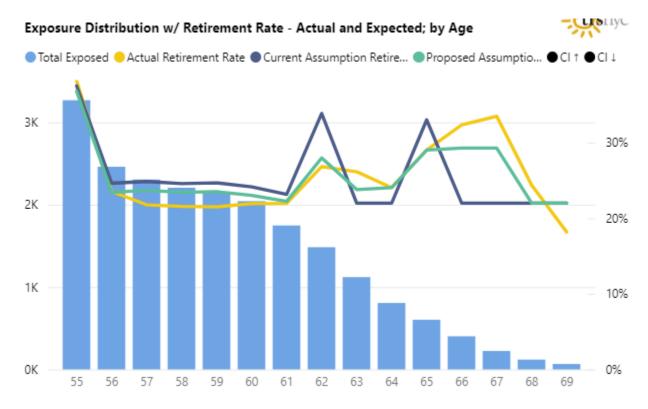

This chart shows the results by age for the service range 10 to 24 years, which decreased the assumed rate of retirement from 4.77% to 3.67% as compared to the actual rate of 3.37%. This resulted in an increase in the A/E ratio from 0.71 to 0.92 for ages 55 to 79. For early retirement ages 55 to 61, the A/E ratio increased from 0.88 to 0.93 and for normal retirement ages 62 to 69, the A/E ratio increased from 0.49 to 0.89.

Retirement

Milliman Section II – TRS Retirement

This chart shows the results by age for the service range 25 to 39 years, which decreased the assumed rate of retirement from 27.04% to 26.08% as compared to the actual rate of 25.72%. This resulted in an increase in the A/E ratio from 0.95 to 0.99 for unreduced retirement ages 55 to 69.

Age 55 and 27 Plan (Plans H and I)

The following table shows the experience of the Age 55 and 27 Plan (Ch 19/08 – 55/27 [Mandatory]) by service based on the age range (55 to 69) and service range (5 to 19) for the period 2016 – 2021 for all types of retirement. There was nearly no experience for service periods in excess of 19 years and so it was excluded from the analysis. The proposed assumptions reflect experience from the Basic Tier IV Plan adjusted for these plan provisions accordingly.

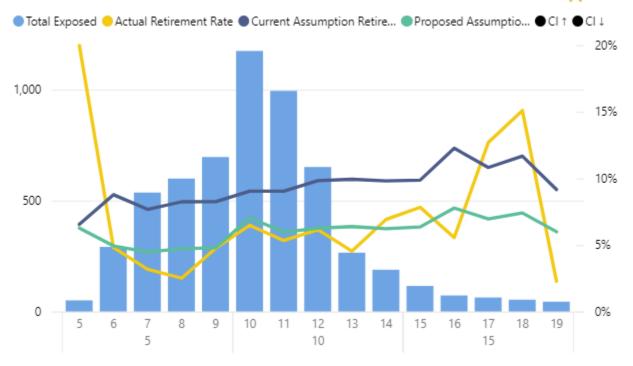

The actual rate of retirement averaged 5.40% whereas the overall expected rate of retirement averaged 8.96% based on the current assumptions and 5.84% based on the proposed assumptions.

Exposure Distribution w/ Retirement Rate - Actual and Expected; by Age

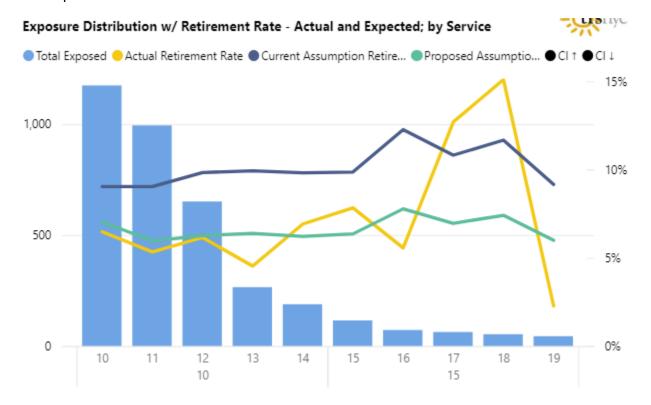

Retirement Rate - Actual, Expected, and Ratio; by Age

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

The following table shows the experience of the Age 55 and 27 Plan (Ch 504/09 - 55/27 [Mandatory])) by age based on the age range (55 to 69) and service range (10 to 19) for the period 2016 - 2021 for all types of retirement. Since 10 years of service was required for retirement during the study period, service prior to 10 years was excluded. Nearly all of the retirement experience occurred for service periods 10 - 12 years. The proposed assumptions reflect experience from 55 and 27 Plan H and the Basic Tier IV Plan adjusted for these plan provisions accordingly.

The actual rate of retirement averaged 6.19% whereas the overall expected rate of retirement averaged 9.45% based on the current assumptions and 6.49% based on the proposed assumptions.

Summary

In total, the proposed rates of retirement have decreased the anticipated number of retirements. Typically, lower rates of retirement will result in a decrease in plan liabilities. However, higher assumptions are proposed for members with at least 20 years of service essentially increase the number of members retiring with a 2% benefit accrual which would lead to higher plan liabilities. The actual impact will depend on the demographics of the active membership.

Assumption Tables

The following table shows the current assumptions.

NEW YORK CITY TEACHERS' RETIREMENT SYSTEM CURRENT PROBABILITIES OF SERVICE RETIREMENT

 $^{^{8}}$ 35.00% at 25 years of service

 $^{^9}$ 24.00% at 30 years of service

Disability

The current ordinary and accidental disability assumptions vary by age and gender. The ordinary disability benefit is equal to 1/60 times final average salary for each year of service accrued but no less than 1/3 of the member's final average salary. The accidental disability retirement is 2/3 of the final average salary. The benefit is payable during the lifetime of the member and members may select any optional form of payment. For members eligible for retirement, the greater of the service retirement benefit and the disability retirement benefit is payable. For members who have accrued at least 20 years of service, the service retirement benefit exceeds the ordinary disability retirement benefit if the member has met the conditions for an unreduced retirement benefit.

Due to this fact, rates or ordinary disability were determined excluding the experience for members eligible for unreduced retirement and the 2% benefit accrual formula. Therefore, we propose the rates of ordinary disability do not apply upon attainment of age 62 and completion of 20 years of service or other criteria to receive an unreduced retirement benefit that varies by Plan (55 and 30 for Basic Plan; 55 and 25 for Plan G and 55 and 27 for Plans H and I). If eligible for early retirement, we propose that the greater of the early retirement benefit and the ordinary disability retirement be valued.

In addition, the rates of ordinary disability would not apply during the 10-year eligibility service period. Finally, we propose the accidental disability rates would cease to apply at completion of 35 years of service.

In performing the experience analysis, it is necessary to reassign disability retirement codes retroactively to reflect the eventual approval of a disability retirement. Members with a disability code in a given year had all inactive status codes in prior years changed to a disability status code. Adjustments were made as far back as 2012.

It is difficult to determine how future years would impact the experience during the study period as we believe that this type of retroactive adjustment will be required in subsequent iterations of this study. The consequence will be a restatement of the number of disability retirements experienced during this study period, specifically 2019 – 2021.

For this purpose, our analysis reflected years from 2012 – 2019.

Ordinary Disability

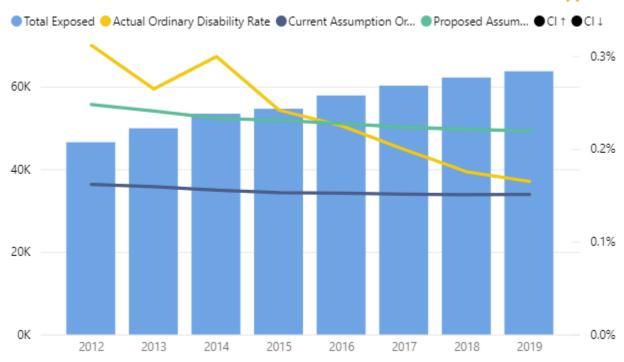

The following table shows the experience for ordinary disability retirement by year, for the age range 30 to 69 and the service range 10 to 34 who have not met the conditions for unreduced retirement and the 2% benefit formula. The actual rate of ordinary disability averaged 0.2304% whereas the overall expected rate of ordinary disability averaged 0.1539% based on the current assumptions and 0.2294% based on the proposed assumptions.

Disability

Males

The following table shows the experience of male members by age based on the age range (30 to 69) and service range (10 to 34) for the period 2012 – 2019 for all plans. The actual rate of ordinary disability averaged 0.2015% whereas the overall expected rate of ordinary disability averaged 0.1325% based on the current assumptions and 0.2057% based on the proposed assumptions. This resulted in a decrease in the A/E ratio from 1.52 to 0.98.

Disability

Females

The following table shows the experience of female members by age based on the age range (30 to 69) and service range (10 to 34) for the period 2012 – 2019 for all plans. The actual rate of ordinary disability averaged 0.2385% whereas the overall expected rate of ordinary disability averaged 0.1599% based on the current assumptions and 0.2361% based on the proposed assumptions. This resulted in a decrease in the A/E ratio from 1.49 to 1.01.

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

Section II – TRS Disability

Summary

Milliman

Retirement eligibility and the change in the benefit accrual rate upon completing 20 years of service have a significant impact on the number of members who apply for disability retirement. By eliminating rates of ordinary disability retirement at these criteria, we believe it will increase plan liabilities. Furthermore, increasing the rates of ordinary disability for other members will also result in higher plan liabilities.

Accidental Disability

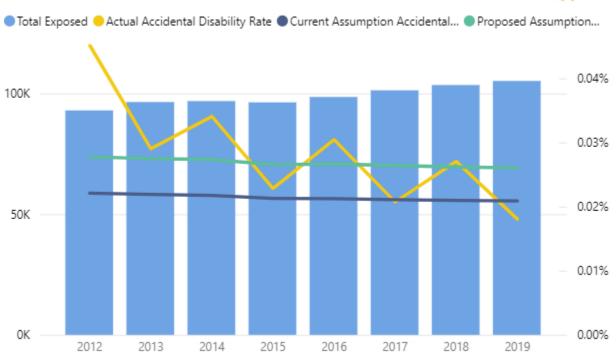

The current accidental disability assumption varies by gender and age. The proposed assumption maintains the same structure. The following charts show the experience for accidental disability retirement by year for the age range 25 to 69 and for the service range 0 to 34. The actual rate of accidental disability averaged 0.0256% whereas the overall expected rate of accidental disability averaged 0.0193% based on the current assumptions and 0.0241% based on the proposed assumptions.

Exposure Distribution w/ Accidental Disability Rate - Actual and Expected; by Year

Milliman

Accidental Disability Rate - Actual, Expected, and Ratio; by Year

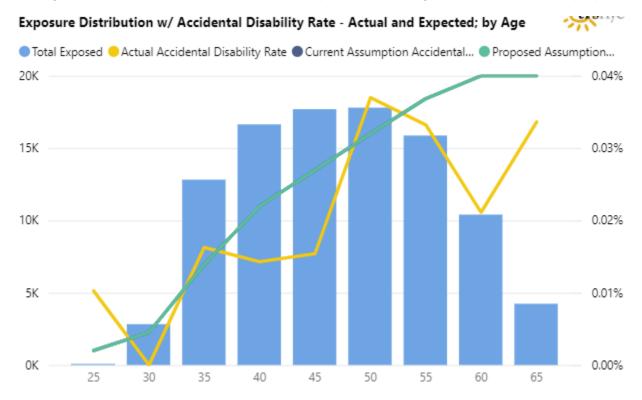

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

Disability

Males

Milliman

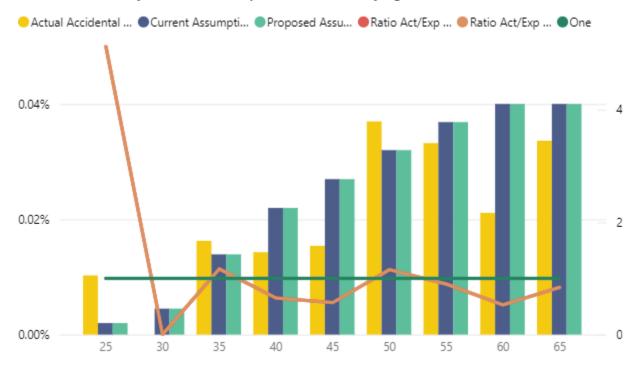

The following table shows the experience of male members by age based on the age range (25 to 69) and service range (0 to 34) for the period 2012 – 2019 for all plans. The actual rate of accidental disability averaged 0.0180% whereas the overall expected rate of accidental disability averaged 0.0214% based on the current assumptions. No change in the assumption is proposed.

Milliman Section II – TRS

Disability

Accidental Disability Rate - Actual, Expected, and Ratio; by Age

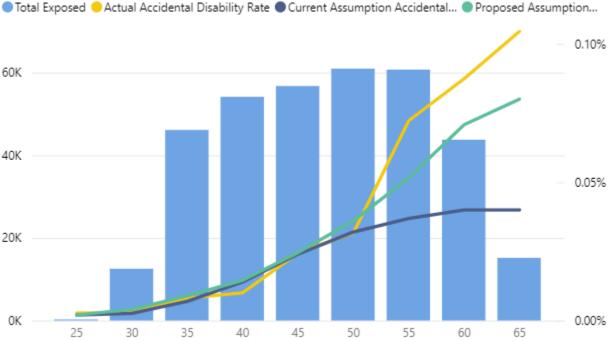

Disability

Females

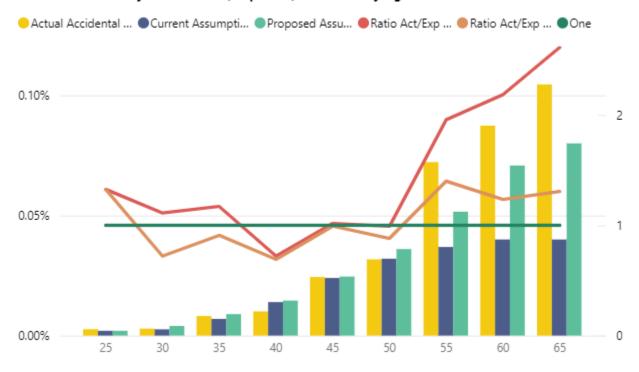

The following table shows the experience of female members by age based on the age range (25 to 69) and service range (0 to 34) for the period 2012 – 2019 for all plans. The actual rate of accidental disability averaged 0.0278% whereas the overall expected rate of accidental disability averaged 0.0187% based on the current assumptions and 0.0249% based on the proposed assumptions. This resulted in a decrease in the A/E ratio from 1.49 to 1.12.

Disability

Accidental Disability Rate - Actual, Expected, and Ratio; by Age

Summary

For female members, the proposed rates have increased the anticipated number of accidental disability retirements, which will result in an increase in plan liabilities. No change is proposed for male members.

Assumption Tables

The following table shows the current assumptions.

Greater of disability benefit and retirement benefit is valued if eligible for early or service retirement

Basic Plan (Plan F): Age 62 and 20 years of service or Age 55 and 30 years of service Tier 6 (Plan J): Age 63 and 20 years of service

55/27 (Plans H&I): Age 62 and 20 years of service or Age 55 and 27 years of service 55/25 (Plans G): Age 62 and 20 years of service or Age 55 and 25 years of service

² No rates of ordinary disability apply prior to completion of 10 years of service or upon attainment of the following age/service combinations:

³ No rates of accidental disability apply upon completion of 35 years of service

Pre-retirement Death

Plan codes excluded in the analysis of other contingencies are part of the analysis of preretirement death.

Mortality assumptions involve two components: a base table and a mortality improvement scale. The mortality improvement scale adjusts the mortality rates of the base table to reflect that generally rates of mortality are anticipated to improve over time.

The Society of Actuaries (SOA) has published mortality improvement scales (MP scales) each year from 2014 to 2021. In the last several actuarial valuations, OA has used the mortality improvement scale that coincides with the valuation date. For example, OA used the MP-2020 scale in its June 30, 2020 lag actuarial valuation. In this analysis, we used the most recent improvement scale (MP-2021) published by the SOA as of the date of this analysis. Please note that the SOA has not published an updated MP scale due to the pandemic.

The SOA MP-2021 improvement scale is based on data through 2019 (before the onset of Covid) from the Social Security Administration (SSA). Even though the aggregate (for all ages) long-term trend has been towards mortality improvements, this is not always the case for each age. Therefore, there are situations where the expected mortality rate in a later year is higher than base rate.

There is much discussion in the actuarial profession and among retirement systems about the development of mortality tables and treatment of excess deaths due to the Covid pandemic, which occurred in 2020 – 2022. The analysis to develop our recommendations exclude the mortality experience of members during the pandemic and reflect the experience from 2012 - 2019.

In this study the base table of the current assumption corresponds to the year 2012; expected mortality rates in future years are obtained from the base table and the MP-2021 scale. For example, the 2017 (July 1, 2016 – June 30, 2017) mortality rates are derived from the base table (2012) adjusted with four years of improvements until 2016. This method links mortality rates across the years and, consequently, allows mortality comparisons from one year to another.

For the proposed assumption, proposed rates were initially determined as of the mid-year of the study period or fiscal year 2016. MP-2021 was then used to adjust those rates to earlier and later years. The proposed mortality rates shown in the following section have been adjusted to reflect a base year of 2019. We recommend that MP-2021 continue to be used to reflect mortality improvements both before and after the measurement date.

In reviewing the current assumption, we compared the actual experience to published tables from the SOA. The most recent tables published by the SOA reflected experience for public plan retirement systems separated into Teachers (PubT), General employees (PubG) and Public Safety (PubS) members. Adjustments were made to the standard SOA tables to match the experience of the system or the current tables, and for consistency with recommended postretirement mortality tables, to determine if the SOA tables provided a better fit.

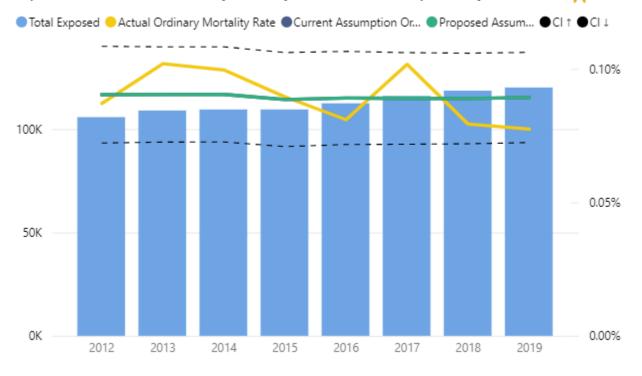

Ordinary Death

For TRS, we compared the experience to PubT tables adjusted by 120% for males and 115% for females. We found the current assumption to provide a better fit and propose no change.

The following tables show the experience of ordinary death by year, for the age range (20 to 69) during the period 2012 – 2019 based on the proposed assumption for both males and females combined. No change in the assumption is recommended. The A/E ratio is 1.00.

| Plan Year | Actual Ordinary Deaths | Expected Ordinary Deaths Proposed | Total Exposed | Actual Ordinary Mortality Rate | Proposed Assumption Ordinary Mortality | Prop Ord | /Exp posed inary tality |
|--------------|------------------------------|--|------------------|---|---|-------------|----------------------------------|
| 2012 | 92 | 95.5 | 105,737 | 0.0870% | 0.0904% | | 0.96 |

Ordinary Mortality Rate - Actual, Expected, and Ratio; by Year

Actual vs. Expected - Ordinary Mortality Proposed w/ Exposure Bubbles; by Year

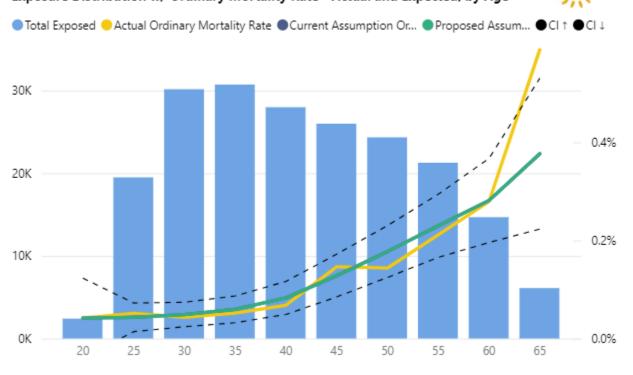

The following section displays results by gender.

Males

The following charts show the experience of ordinary death by age band, for the age range (20 to 69) during the period 2012 – 2019 based on the proposed assumption. No change in the assumption is recommended. The A/E ratio is 0.99. Please note that the charts by age are based on 5-year brackets. For example, the age bracket 45 should be interpreted as the interval 45 – 49.

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

Postretirement Mortality

In addition to gender, the post-retirement mortality assumption depends on the type of inactive member:

- 1) Service Retirees
- 2) Disabled Retirees
- 3) Contingent Beneficiaries

The MEST contains all retirees on one page and beneficiaries on another page. On the retiree page, the experience can be examined by status to review disabled retirees versus service retirees. Service retirees include members who have commenced their pension benefit from a terminated vested status in addition to members who have retired from active status. There is a separate MEST containing the postretirement mortality experience of members across all NYCRS systems, which allowed us to review experience and develop proposed assumptions over multiple systems where it was advantageous to do so.

There is much discussion in the actuarial profession and among retirement systems about the development of mortality tables and treatment of excess deaths due to the Covid pandemic, which occurred in 2020 – 2022. The analysis to develop our recommendations excludes the mortality experience of members during the pandemic and reflects the experience from 2015 - 2019. Experience prior to 2015 was excluded as benefit amounts were not available in the historical database prior to this period.

Most mortality studies have found that higher benefits are positively correlated with smaller mortality rates and longer life expectancy. Accordingly, the OA utilizes adjustment factors to convert post-retirement mortality weighted by headcounts to post-retirement mortality weighted by benefit amounts. The current assumption adjustment factors used by the OA are:

| Post-Retirement Mortality Adjustment Factor To Convert from Headcount-Weighted to Amount-Weighted | | | | | | | |
|---|-------------------|---------------|--|--|--|--|--|
| To Convert from Headcount | -vveignted to Amo | unt-vveighted | | | | | |
| Males Females | | | | | | | |
| Service Retiree | 0.908 | 0.944 | | | | | |
| Disabled Retiree 0.940 0.962 | | | | | | | |
| Contingent Beneficiary 0.890 0.951 | | | | | | | |

Mortality assumptions involve two components: a base table and a mortality improvement scale. The mortality improvement scale adjusts the mortality rates of the base table to reflect that generally rates of mortality are anticipated to improve over time. As noted in the pre-retirement death section, we used the most recent improvement scale (MP-2021) published by the SOA as of the date of this analysis. Please note that the SOA has not published an updated MP scale due to the pandemic.

In this study the base table of the current assumption corresponds to the year 2012; expected mortality rates in future years are obtained from the base table and the MP-2021 scale. For example, the 2017 (July 1, 2016 – June 30, 2017) mortality rates are derived from the base table (2012) adjusted with four years of improvements until 2016. This method links mortality rates across the years and, consequently, allows mortality comparisons from one year to another.

For the proposed assumption, proposed rates were initially determined as of the mid-year of the study period or fiscal year 2017. MP-2021 was then used to adjust those rates to earlier and later years. The proposed mortality rates shown in the following section have been adjusted to reflect a base year of 2019. We recommend that MP-2021 continue to be used to reflect mortality improvements both before and after the measurement date.

In reviewing the current assumption, we compared the actual experience to published tables from the SOA. The most recent tables published by the SOA reflected experience for public plan retirement systems separated into Teachers (PubT), General employees (PubG) and Public Safety (PubS) members. The SOA publishes versions of each of these tables where the mortality rates are weighted by the amount of the pension benefit ("amount-weighted") or weighted by the number of members (headcount-weighted). We compared the amount-weighted experience to the amount-weighted SOA table and the headcount-weighted experience to the headcount-weighted SOA tables. Adjustments were made to the applicable standard SOA tables to match the experience of the system to determine if the SOA tables provided a better statistical fit to the experience.

The SOA combined the experience of teachers and general employees in developing disability annuity mortality tables. Due to lack of credibility, a relatively lower disability incidence rate and consistency with the SOA tables, we combined the experience of TRS, BERS and NYCERS (general, sanitation, transit, and TBTA) in proposing a recommended assumption.

The SOA also combined the experience of all contingent beneficiaries (teachers, general employees and public safety members) into a single table. We combined the experience of all NYCRS systems (TRS, BERS, NYCERS, POLICE and FIRE) in proposing a recommended assumption. The contingent survivor assumption would apply upon the death of the member. While both the member and contingent survivor are both alive, we propose the healthy annuitant mortality table apply.

In the actuarial valuation of pension benefits, we recommend that amount-weighted mortality rates be used. Headcount-weighted mortality rates may be used for other purposes, such as a retiree medical valuation.

Postretirement Mortality – Service Retirees

For TRS, we compared the experience to PubT tables and found the current assumption provides a better statistical fit. We propose adjustments to the current amount-weighted assumption to reflect actual experience by age. Separate adjustments were then made to determine headcount-weighted proposed rates.

The following charts show postretirement mortality experience on a headcount-weighted basis by year for the age range (55 to 104) during the period 2015 – 2019 for both males and females combined on the current and proposed assumptions. The A/E increased from 0.96 to 0.99.

Pension Benefit Distribution w/ Inactive Mortality Rate - Actual and Expected; by Year

Inactive Mortality Rate - Actual, Expected, and Ratio; by Year

Actual vs. Expected - Inactive Mortality Proposed w/ Benefit Bubbles; by Year

The following section displays results by gender.

Service Retirees - Males

The following charts show postretirement mortality experience on an amount-weighted basis by age band for the age range (55 to 104) during the period 2015 – 2019 for males on the current and proposed assumptions. While the A/E decreased from 1.00 to 0.98, the overall fit for each group improved. For ages 55 to 74, the A/E increased from 0.88 to 0.98 and for ages 75 – 104, the A/E decreased from 1.05 to 0.99.

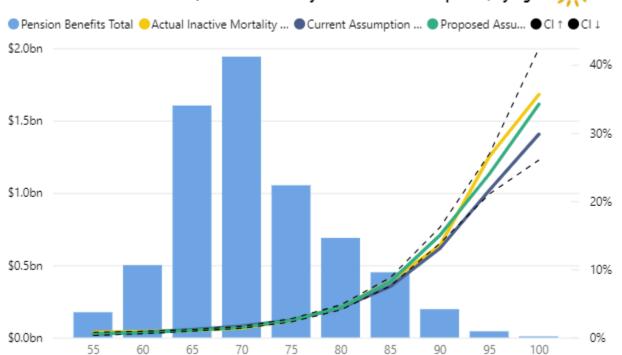

Please note that the charts by age are based on 5-year brackets. For example, the age bracket 75 should be interpreted as the interval 75 - 79.

Exposure Distribution w/ Inactive Mortality Rate - Actual and Expected; by Age

Inactive Mortality Rate - Actual, Expected, and Ratio; by Age

Service Retirees - Females

The following charts show postretirement mortality experience on an amount-weighted basis by age band for the age range (55 to 104) during the period 2015 – 2019 for females on the current and proposed assumptions. While the A/E remained at 0.99, the overall fit for each group improved. For ages 55 to 74, the A/E increased from 0.91 to 0.97 and for ages 75 – 104, the A/E decreased from 1.02 to 0.99.

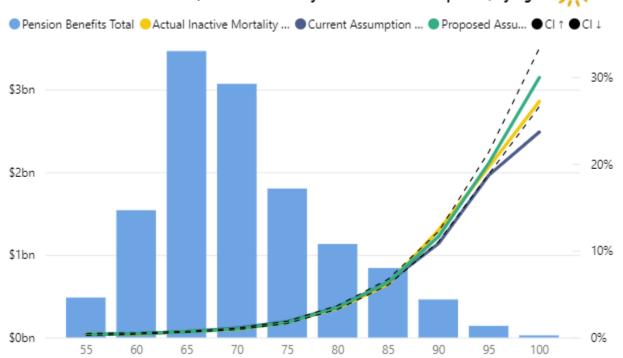

Please note that the charts by age are based on 5-year brackets. For example, the age bracket 75 should be interpreted as the interval 75 - 79.

Exposure Distribution w/ Inactive Mortality Rate - Actual and Expected; by Age

Section II - TRS

Postretirement Mortality

Summary

We have proposed new assumptions to better reflect recent non-pandemic experience. In total, the proposed mortality tables are anticipated to increase plan liabilities for younger retirement ages up to about mid-70s and then anticipated to decrease plan liabilities for older retirement ages. We would anticipate that this would increase plan liabilities for current active members but reduce liabilities for retirees. The actual impact will depend on the relative change for each group.

Assumption Tables

The following table shows the current assumptions.

Postretirement Mortality – Disability Retirees

The SOA combined the experience of teachers and general employees in developing disability annuity mortality tables. Due to lack of credibility, a relatively lower disability incidence rate and consistency with the SOA tables, we combined the experience of TRS, BERS and NYCERS (general, sanitation, transit, and TBTA) in proposing a recommended assumption. We propose to use the PUB disabled annuitant non-public safety mortality table, without any adjustment. Separate tables exist on a headcount-weighted and amount-weighted basis.

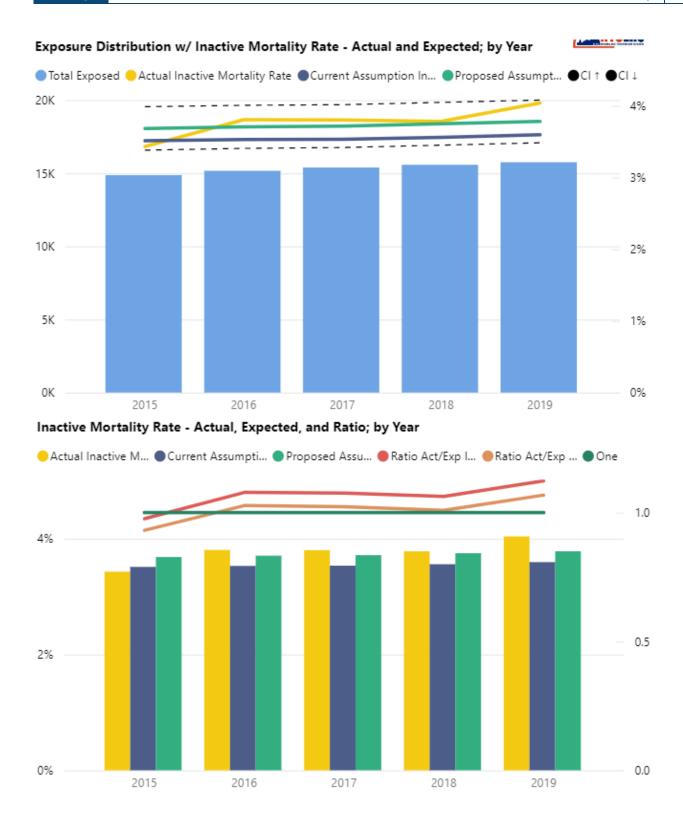

The following charts show postretirement mortality experience on a headcount-weighted basis by year for the age range (50 to 99) during the period 2015 – 2019 for both males and females combined on the current and proposed assumptions for all non-public safety members of NYCRS. The A/E decreased from 1.06 to 1.01 and decreased from 1.11 to 0.88 for only TRS.

Current Assumption – Headcount-weighted

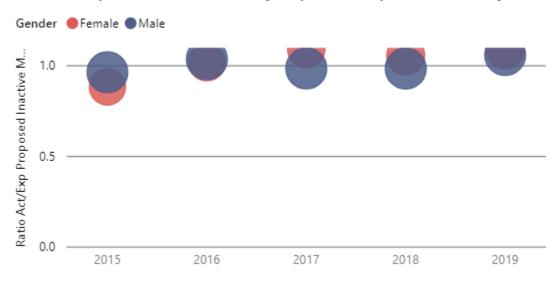

| Plan Year | Actual Inactive Deaths | Expected Inactive Deaths | Total Exposed | Actual Inactive Mortality Rate | Current Assumption Inactive Mortality | Ratio Act/Exp Inactive Mortality | |

Pension Benefit Distribution w/ Inactive Mortality Rate - Actual and Expected; by Year

Inactive Mortality Rate - Actual, Expected, and Ratio; by Year

The following section displays results by gender.

Disabled Retirees - Males

The following charts show postretirement mortality experience on an amount-weighted basis by age band for the age range (50 to 99) during the period 2015 – 2019 for males on the current and proposed assumptions for all non-public safety members of NYCRS. The A/E decreased from 1.01 to 0.99 and decreased from 1.03 to 0.84 for only TRS.

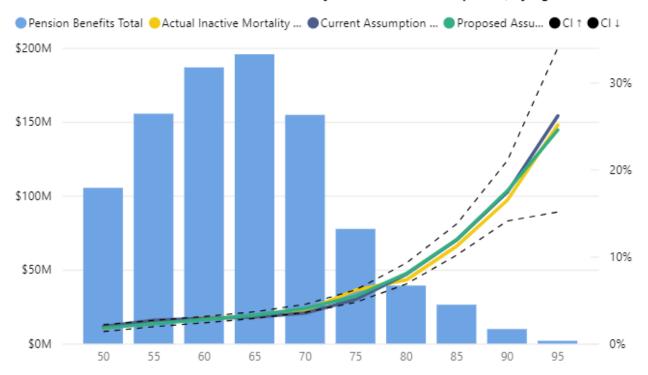

Please note that the charts by age are based on 5-year brackets. For example, the age bracket 75 should be interpreted as the interval 75 – 79.

Pension Benefit Distribution w/ Inactive Mortality Rate - Actual and Expected; by Age

Inactive Mortality Rate - Actual, Expected, and Ratio; by Age

Headcount-weighted

The following charts show postretirement mortality experience on a headcount-weighted basis by age band for the age range (50 to 99) during the period 2015 – 2019 for males on the current and proposed assumptions for all non-public safety members of NYCRS. The A/E decreased from 1.06 to 1.00 and decreased from 1.13 to 0.89 for only TRS.

Exposure Distribution w/ Inactive Mortality Rate - Actual and Expected; by Age

Inactive Mortality Rate - Actual, Expected, and Ratio; by Age

Disabled Retirees - Females

The following charts show postretirement mortality experience on an amount-weighted basis by age band for the age range (50 to 99) during the period 2015 – 2019 for females on the current and proposed assumptions for all non-public safety members of NYCRS. The A/E decreased from 1.07 to 1.03 and decreased from 1.05 to 0.86 for only TRS.

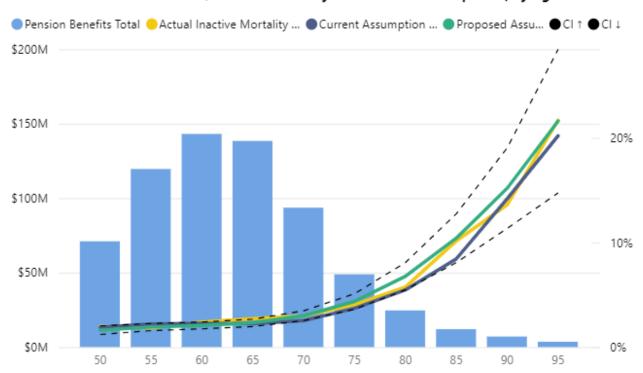

Please note that the charts by age are based on 5-year brackets. For example, the age bracket 75 should be interpreted as the interval 75 - 79.

Inactive Mortality Rate - Actual, Expected, and Ratio; by Age

Summary

We have proposed new assumptions consistent with industry standards. In total, the proposed mortality tables are anticipated to decrease plan liabilities.

Assumption Tables

The following table shows the current assumptions.

Postretirement Mortality - Contingent Beneficiaries

The SOA combined the experience of all contingent beneficiaries of teachers, general employees and public safety members in developing contingent survivor annuity mortality tables. We combined the experience of all NYCRS systems (TRS, BERS, NYCERS, POLICE and FIRE) in proposing a recommended assumption. We propose to use the PUB contingent survivor annuitant mortality tables, multiplied by adjustment factors. Separate tables exist on a headcount-weighted and amount-weighted basis in addition to gender.

For males, the proposed adjustment factors are 125% for amount-weighted and 120% for headcount-weighted. For females, the proposed adjustment factors are 120% for amount-weighted and 108% for headcount-weighted.

The contingent survivor assumption would apply upon the death of the member. While both the member and contingent survivor are both alive, we propose the healthy annuitant mortality table apply.

The following charts show postretirement mortality experience on a headcount-weighted basis by year for the age range (60 to 104) during the period 2015 - 2019 for both males and females combined on the current and proposed assumptions for all members of NYCRS. The A/E decreased from 1.12 to 1.00 and decreased from 1.14 to 1.00 for only TRS.

Beneficiary Mortality Rate - Actual, Expected, and Ratio; by Year

The following section displays results by gender.

Contingent Beneficiaries - Males

The following charts show postretirement mortality experience on an amount-weighted basis by age band for the age range (60 to 104) during the period 2015 – 2019 for males on the current and proposed assumptions for all members of NYCRS. The A/E decreased from 1.52 to 1.11 and decreased from 1.54 to 1.12 for only TRS.

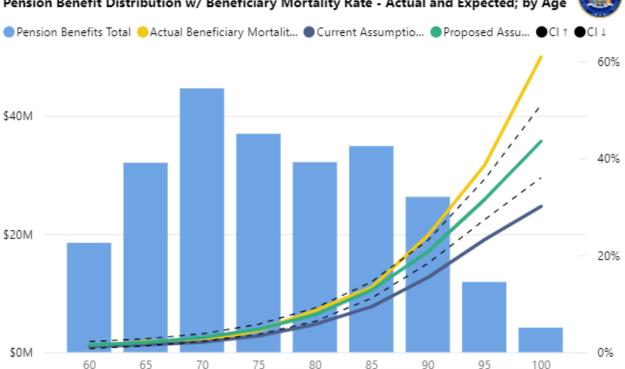

Please note that the charts by age are based on 5-year brackets. For example, the age bracket 75 should be interpreted as the interval 75 – 79.

Part II Experience Study Report - TRS and BERS New York City Retirement Systems

162

Contingent Beneficiaries - Females

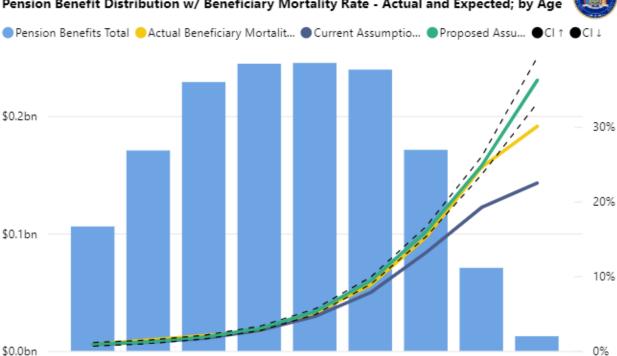

The following charts show postretirement mortality experience on an amount-weighted basis by age band for the age range (60 to 104) during the period 2015 – 2019 for females on the current and proposed assumptions for all members of NYCRS. The A/E decreased from 1.16 to 0.96 and decreased from 1.18 to 0.98 for only TRS.

Please note that the charts by age are based on 5-year brackets. For example, the age bracket 75 should be interpreted as the interval 75 - 79.

Part II Experience Study Report - TRS and BERS New York City Retirement Systems

166

This work product was prepared solely for New York City Comptroller's Office for the purposes described herein and may not be appropriate to use for other purposes. Milliman does not intend to benefit and assumes no duty or liability to other parties who receive this work.

We have proposed new assumptions consistent with industry standards. In total, the proposed mortality tables are anticipated to decrease plan liabilities.

Assumption Tables

The following table shows the current assumptions.

NEW YORK CITY TEACHERS' RETIREMENT SYSTEM CURRENT PROBABILITIES OF MORTALITY FOR BENEFICIARIES BASE TABLE

^{*} This table is to be utilized for beneficiary mortality after the retiree's death. Service retirement mortality is used for the beneficiary while the retiree is alive

Section III – Board of Education Retirement System of the City of New York (BERS)

Exposures and Decrements

To set the exposures and actual decrements for BERS, the following table details the age and service conditions for unreduced retirement and reduced retirement. If a member has not met any of these conditions for the indicated plan code by year, the member is considered a withdrawal exposure. Otherwise, if the member did meet any of these conditions, they would be considered a retirement exposure. Members with a status code of termination who, nonetheless, have met the conditions for retirement, are included as actual retirements.

Using the age and service slider, a user can drill down to view the results that reflect a variety of conditions by plan code, such as reduced retirement, retirement at first eligibility, or other conditions for retirement.

Please note that withdrawal and retirement exposures for Plan Codes A – D and J were excluded from the tool because there are very few of them remaining at the end of the study period.

For certain plans such as the Tier 6 plans and the Ch 504/09 – 55/27 Mandated plan, the vesting requirement was reduced from 10 years to 5 years with the passage of Chapter 56, Laws of 2022. Since 10-year vesting was required during the study period, we have used 10 years in this report.

OA's retirement assumptions depend on whether a member can choose a certain retirement plan. If a member had a choice and elected the improved plan, the assumed rates of retirement are higher than those in which the member was mandated into the specific retirement plan. Higher rates of retirement apply to the indicated plan when the Mandated column is set to False. All Tier 6 plans are considered Mandated plans.

Members whose work involved physically taxing activities are subject to less stringent requirements to qualify for benefits in terms of retirement age. To facilitate the analysis of these members, we created two new codes:

- Plan Code N for Tier IV Chapter 96 age 57 plan members, who were initially included in Plan Code I or Plan Code M. Plan Code I and Plan Code M are the same plan, but in some years the plan was referred to as Plan Code I and in other years as Plan Code M.
- Plan Code W for Tier IV Chapter 96 optional 55 and 25 members, who were initially included in Plan Code H.

We understand that for certain elected plans with unreduced retirement benefits at age 55 and 25 or 27 years of service, the OA assumes immediate reduced retirement for members who have not met the stated condition for unreduced retirement but have met the condition for early retirement under the Tier IV basic plan (age 55 and completion of 5 years of service). In these situations, OA applies the rates of termination at these age/service conditions and not reduced rates of retirement. These members are included as a retirement exposure but both the current and proposed assumption reflects the reduced retirement assumption.

Rates of Salary Increase

The rates of salary increase reflect three components: 1) price inflation, 2) real wage inflation and 3) merit increases. The combination of price inflation and real wage inflation is known as wage inflation. The current wage inflation is 3%, which reflects a price inflation assumption of 2.5% and 0.5% real wage inflation.

Based on the 2024 and 2023 OASDI Trustees report issued by Social Security, wage inflation from 2012 to 2020 had a cumulative compound average of 2.93%. Including the rate for 2021 of 9.04%, the average increased to 3.53%. However, in our analysis of the experience, we did not notice any large increases in wages during 2021. This is typical with government sector employees with union affiliations where salary increases are specified in contracts negotiated for a 3- to 5-year period. Thus, wage increases for these employees may not adjust as quickly as for other employment sectors included in the Social Security Trustees report.

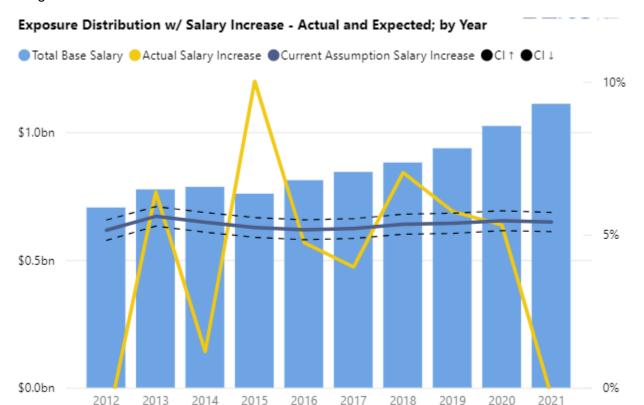

For purposes of our analysis, we believe the 3% current wage inflation is representative of the actual experience during the study period. While inflation has been higher since 2021, we propose no changes to the inflation assumption of 2.5% and wage inflation assumptions of 3%. Therefore, we have developed proposed salary increases based on total salary increases during the indicated period. The merit portion is equal to the total less the 3% wage inflation.

For purposes of salary increases only members with a status code of A in consecutive years are included. Members with a LOA status code are excluded.

Although salary increases for government employees may respond less quickly to changes in inflation, using salary experience from many years in the past may not necessarily be indicative of future salary increases as they may not include changes negotiated in union contracts such as general increases, longevity payments, or other salary items. We reviewed the salary increases by year and determined what we believe was the most reasonable period to compare to the current assumption and develop proposed assumptions.

Salary

The following chart shows the experience by year for the age range 25 to 59 and for the service range 0 to 34.

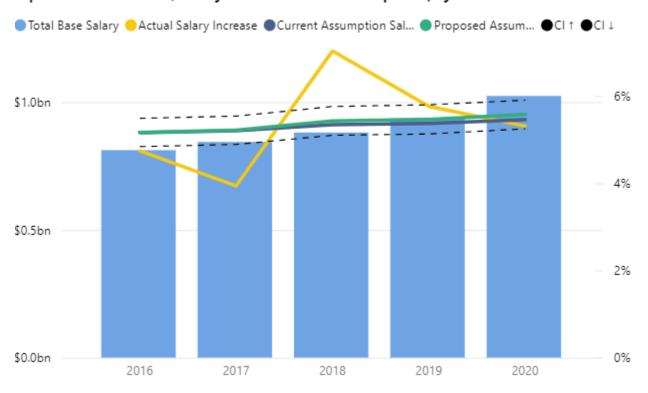

Salary increases for BERS varied significantly from one year to the next. There was a substantial increase in 2015 and effectively there was no average increase in 2021, which is probably impacted by the pandemic. For BERS, we focused on the 5-year period from 2016 – 2020, which appears to be the most stable period.

The current assumed rates of salary increases vary by service. The proposed assumption also varies by service. Overall, the proposed rates of salary increases are very similar to the current assumption.

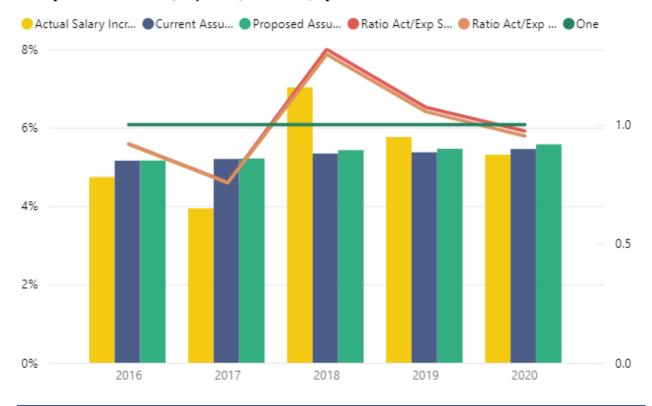

The following table shows the experience for salary increases by year, for the age range (25 to 59), and for the service range (0 to 34) from 2016 - 2020. The actual rate of salary increases averaged 5.38% whereas the overall expected rate of increase averaged 5.31% based on the current assumptions and 5.38% based on the proposed assumptions.

Exposure Distribution w/ Salary Increase - Actual and Expected; by Service

Salary Increase - Actual, Expected, and Ratio; by Service

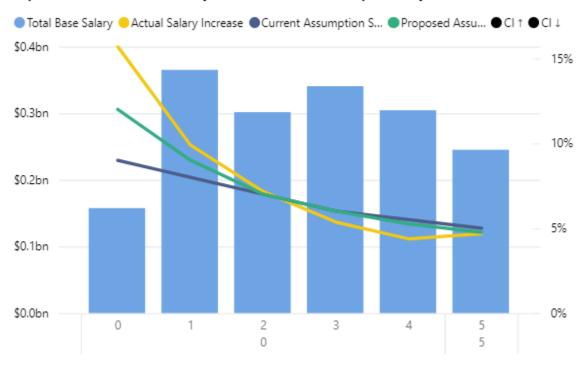

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

183

This chart shows the results by service for the service range 0 to 5 years, which increased the assumed rate of salary increases from 6.65% to 7.05% as compared to the actual rate of 7.32%. This resulted in a decrease in the A/E ratio from 1.10 to 1.04 for ages 25 to 59.

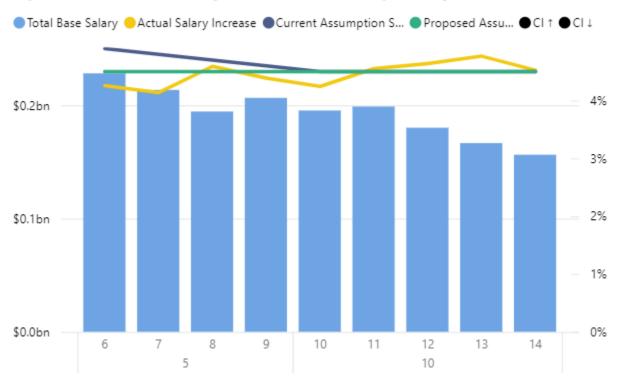

Exposure Distribution w/ Salary Increase - Actual and Expected; by Service

Salary

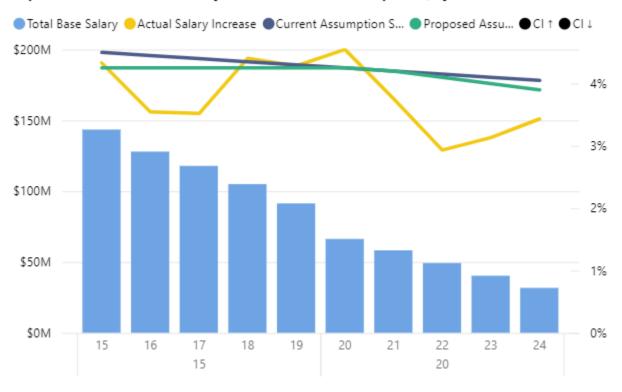

This chart shows the results by year for the service range 6 to 14 years, which decreased the assumed rate of salary increases from 4.62% to 4.50% as compared to the actual rate of 4.44%. This resulted in an increase in the A/E ratio from 0.96 to 0.99 for ages 25 to 59.

Exposure Distribution w/ Salary Increase - Actual and Expected; by Service

This chart shows the results by service for the service range 15 to 24 years, which decreased the assumed rate of salary increases from 4.34% to 4.21% as compared to the actual rate of 3.90%. This resulted in an increase in the A/E ratio from 0.90 to 0.93 for ages 25 to 59.

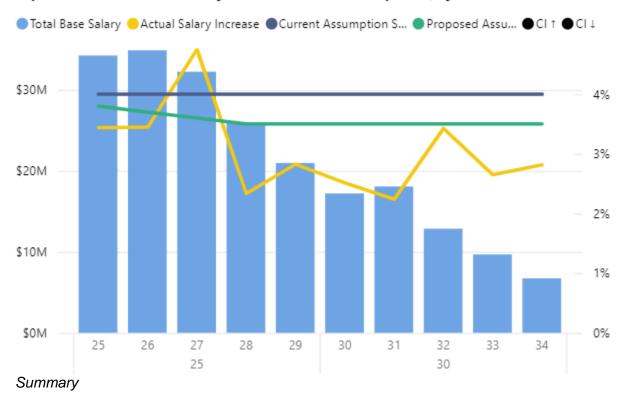

Exposure Distribution w/ Salary Increase - Actual and Expected; by Service

Salary

This chart shows the results by service for the service range 25 to 34 years, which decreased the assumed rate of salary increases from 4.00% to 3.60% as compared to the actual rate of 3.21%. This resulted in an increase in the A/E ratio from 0.80 to 0.89 for ages 25 to 59.

Exposure Distribution w/ Salary Increase - Actual and Expected; by Service

In total, the proposed rates of salary increases are higher than the current assumptions, primarily due to higher assumed salary increases during the first few years of employment. Thereafter, slightly lower salary increases are proposed. We would anticipate that this would decrease plan liabilities.

Withdrawal

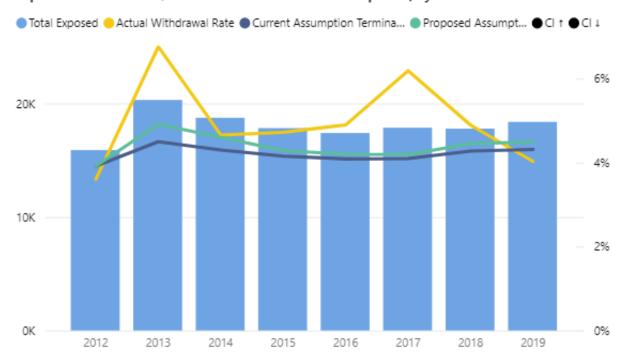

The current withdrawal assumption varies by gender and service. The proposed assumption varies by age in addition to service while a unisex table is proposed. Overall, this results in an increase in the assumed rates of withdrawal, especially at 5 or fewer years of service with lower assumed rates of withdrawal at higher years of service.

The analysis reflected years from 2012 - 2019 as the rate of termination during 2020 and 2021 may be artificially low due to members with a LOA status code. A record with a LOA status code is included as an exposure and not a decrement.

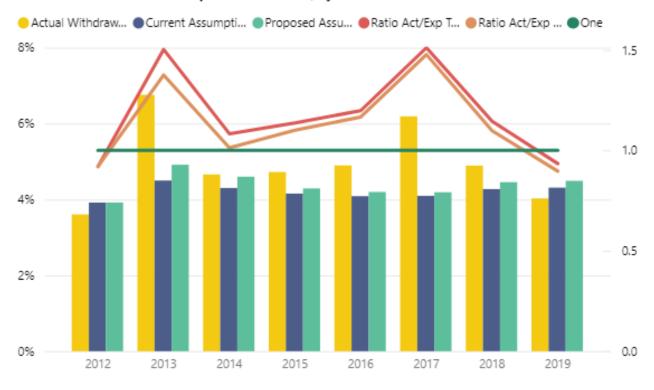

The following table shows the experience for withdrawal by year, for the age range (20 to 59), and for the service range (0 to 29). The actual rate of withdrawal averaged 5.04% whereas the overall expected rate of withdrawal averaged 4.17% based on the current assumptions and 4.43% based on the proposed assumptions.

Withdrawal Rate - Actual, Expected, and Ratio; by Year

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

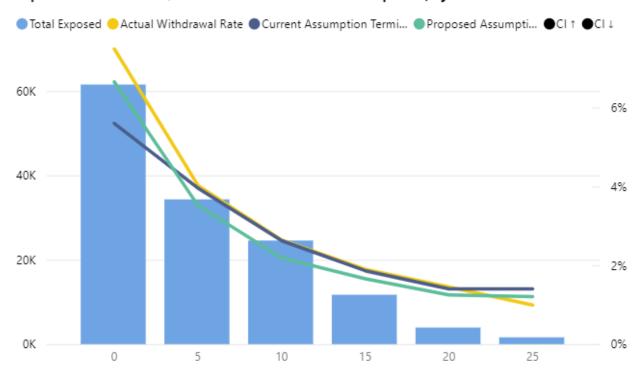

The following charts show the experience by service (0 to 29 years) in the experience study period first compared to the current assumption and then to the proposed assumption. This resulted in a decrease in the A/E ratio from 1.21 to 1.14 for ages 20 to 59. For ages 20 to 39, the A/E ratio decreased from 1.78 to 1.17 and for ages 40 to 59, the A/E ratio increased from 0.93 to 1.11.

Exposure Distribution w/ Withdrawal Rate - Actual and Expected; by Service

Withdrawal Rate - Actual, Expected, and Ratio; by Service w/Proposed

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

194

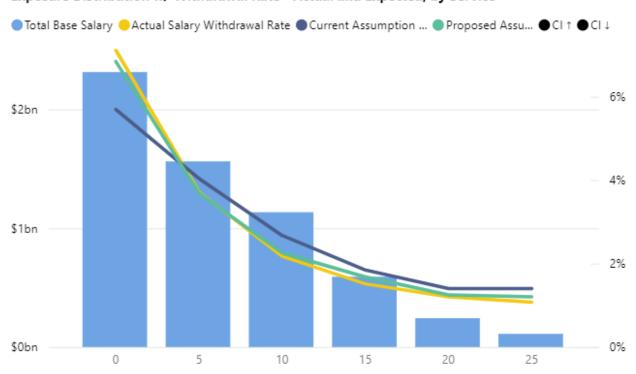

In our analysis, we noticed that members with higher salaries had lower rates of termination than members with lower salaries at the same service level. We therefore weighted the termination rates by each member's salary in developing the proposed assumptions.

The following charts show the experience weighted by salary by service (0 to 29 years) in the experience study period first compared to the current assumption and then to the proposed assumption. The actual rate of withdrawal weighted by salary averaged 4.37% whereas the overall expected rate of withdrawal averaged 4.05% based on the current assumptions and 4.30% based on the proposed assumptions. This resulted in a decrease in the A/E ratio from 1.08 to 1.02 for ages 20 to 59. For ages 20 to 39, the A/E ratio decreased from 1.60 to 1.07 and for ages 40 to 59, the A/E ratio increased from 0.79 to 0.96.

Exposure Distribution w/ Withdrawal Rate - Actual and Expected; by Service

Withdrawal Rate - Actual, Expected, and Ratio; by Service

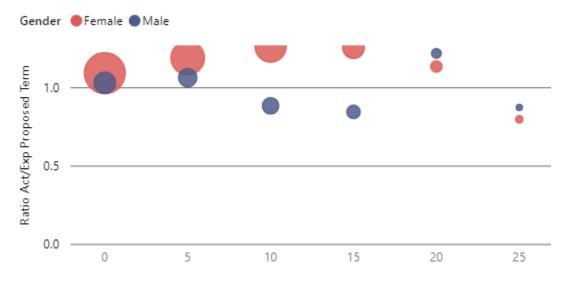

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

Milliman

Withdrawal

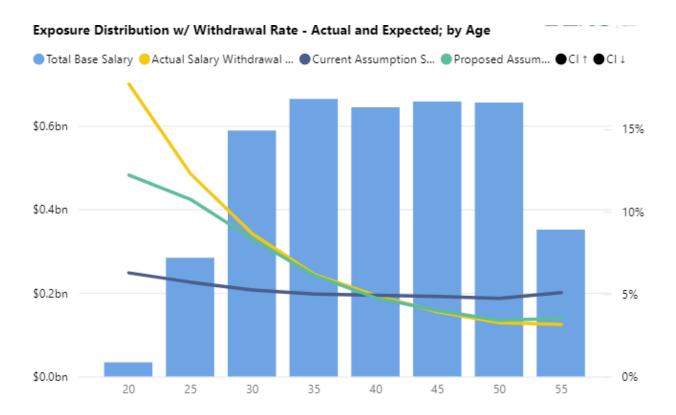

The following chart shows the actual experience by gender versus the proposed assumption. Although there is some indication that the experience varies by gender, it varied more so by age and service and thus, a unisex table is proposed.

Actual vs. Expected - Withdrawal Proposed w/ Exposure Bubbles; by Service

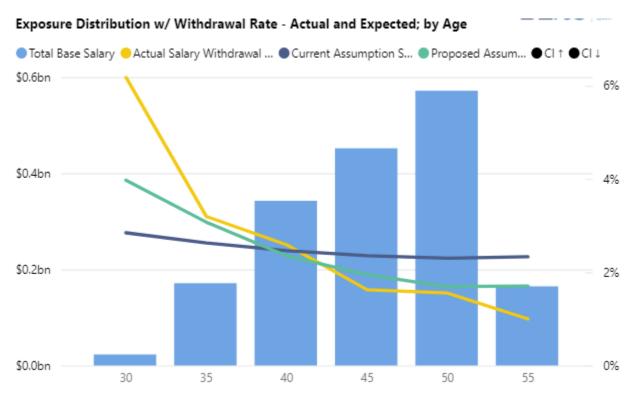

The proposed assumption varies by age in addition to service as we observed lower rates of withdrawal for older members at the same service periods. The following charts show the results by age over 10-year service periods.

This chart shows the results weighted by salary by age for the service range 0 to 9 years, which increased the assumed rate of withdrawal from 5.03% to 5.57% as compared to the actual rate of 5.75%. This resulted in a decrease in the A/E ratio from 1.14 to 1.03 for ages 20 to 59. For ages 20 to 39, the A/E ratio decreased from 1.61 to 1.07 and for ages 40 to 59, the A/E ratio increased from 0.80 to 0.98.

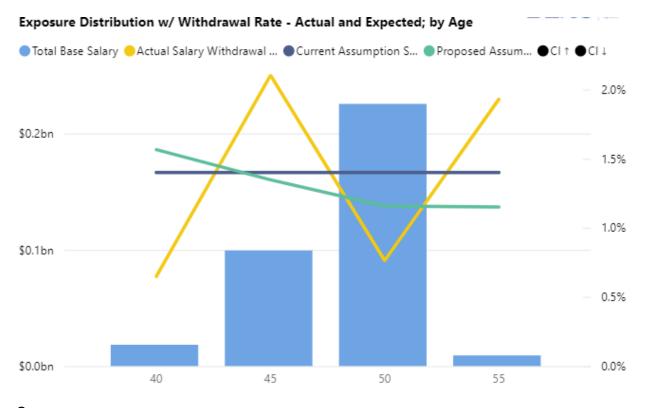

This chart shows the results weighted by salary by age for the service range 10 to 19 years, which decreased the assumed rate of withdrawal from 2.39% to 2.06% as compared to the actual rate of 1.95%. This resulted in an increase in the A/E ratio from 0.82 to 0.95 for ages 30 to 59. For ages 30 to 39, the A/E ratio decreased from 1.34 to 1.12 and for ages 40 to 59, the A/E ratio increased from 0.74 to 0.91.

Withdrawal

This chart shows the results weighted by salary by age for the service range 20 to 29 years, which decreased the assumed rate of withdrawal from 1.40% to 1.23% as compared to the actual rate of 1.17%. This resulted in an increase in the A/E ratio from 0.83 to 0.95 for ages 40 to 59.

Summary

In total, the proposed rates of withdrawal have increased the anticipated number of terminations. Typically, higher rates of withdrawal will result in a decrease in plan liabilities. However, lower assumptions are proposed for longer service members and older members increasing plan liabilities for these members. The actual impact will depend on the demographics of the active membership.

Withdrawal

Assumption Tables

The following table shows the current assumptions.

² Applies to ages 25 and younger

 $^{^{3}}$ Applies to ages 54 and older

Retirement

The current retirement assumption varies by age and eligibility for unreduced retirement with higher rates occurring at first eligibility. Furthermore, higher rates of retirement are assumed for members who had the option to elect an improved program. The proposed assumption varies by service in addition to these elements. Primarily lower rates of retirement are assumed prior to 20 or 25 years of service with even lower rates prior to 10 years of service.

Lower rates of retirement are proposed for members with less than 10 years of service since these members are not eligible for retiree health benefits. Higher rates of retirement are proposed for members with at least 20 years of service or 25 years of service for the improved plan members to reflect the higher benefit accrual rate.

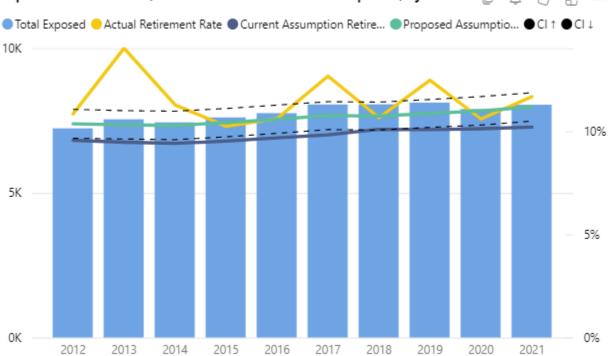

Since Tier 6 became effective on April 1, 2012, and required 10 years of service for vesting, there is little to no retirement experience associated with these plans. Chapter 56 Laws of 2022 changed the vesting requirements for the Tier 6 plans and the Ch 504/09 – 55/27 [Mandatory]) plan to five years of service. Since the vesting requirement was 10 years during the study period, we used the 10-year requirement in this report.

The following table shows the experience for retirement by year, for the age range (55 to 79), and for the service range (5 to 39) for all plans and all types of retirement. The actual rate of retirement averaged 11.51% whereas the overall expected rate of retirement averaged 9.81% based on the current assumptions and 10.66% based on the proposed assumptions.

Retirement Rate - Actual, Expected, and Ratio; by Year

Analysis

We will review the experience for the following plan codes because data was limited for other plan codes. Proposed assumptions were extrapolated to these other codes based on the experience of these plans, adjusted for retirement eligibility requirements.

- 1. Tier IV (plan code F) normal retirement age is 62 with reduced retirement benefits at age 55 using mandated plan retirement rates.
- 2. Chapter 96 Age 57 Plan (Plan Codes I and M) normal retirement age is 57 using mandated plan retirement rates.
- 3. Chapter 19 55/25 Plan (Plan Code K) normal retirement is age 55 with 25 years of service using elected improved plan retirement rates.
 - a. Due to limited exposures, we included other plans in the analysis:
 - i. Plan H: Ch96 Tier IV
 - ii. Plan L: Special Officers (no age requirement)
 - iii. Plan N: Ch96 Tier IV Mandated Physically Taxing (age 50 minimum requirement)
 - iv. Plan W: Ch96 Tier IV Physically Taxing (age 50 minimum requirement)

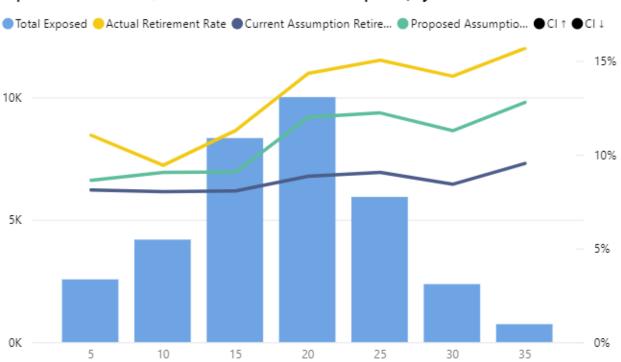

Basic Tier IV Plan (Plan F)

The following table shows the experience of Basic Tier IV Plan by service based on the age range (55 to 79) and service range (5 to 39) for the period 2012 – 2021 for all types of retirement. The actual rate of retirement averaged 12.88% whereas the overall expected rate of retirement averaged 8.52% based on the current assumptions and 10.67% based on the proposed assumptions. This resulted in a decrease in the A/E ratio from 1.51 to 1.21.

Retirement Rate - Actual, Expected, and Ratio; by Age

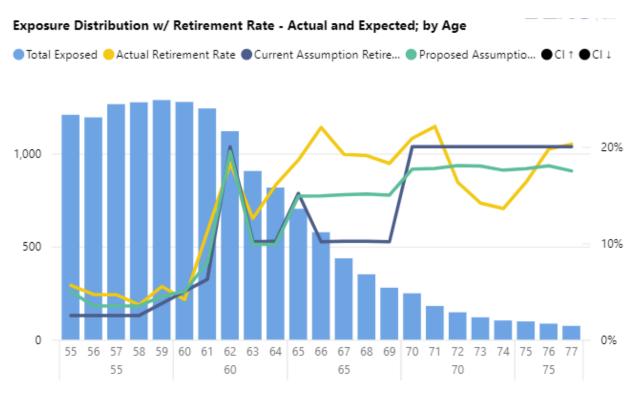

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

Milliman Section III - BERS

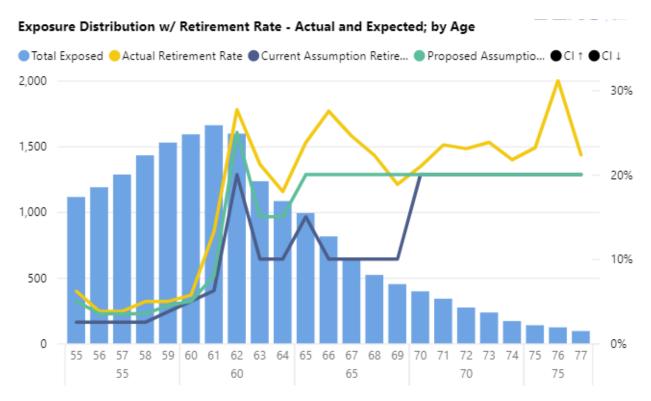

Retirement

This chart shows the results by age for the service range 5 to 19 years, which increased the assumed rate of retirement from 8.06% to 8.99% as compared to the actual rate of 10.73%. This resulted in a decrease in the A/E ratio from 1.33 to 1.19 for ages 55 to 79. For early retirement ages 55 to 61, the A/E ratio decreased from 1.57 to 1.19 and for normal retirement ages 62 to 79, the A/E ratio decreased from 1.25 to 1.19.

Retirement

This chart shows the results by age for the service range 20 to 39 years, which increased the assumed rate of retirement from 8.88% to 12.01% as compared to the actual rate of 14.58%. This resulted in a decrease in the A/E ratio from 1.64 to 1.21 for ages 55 to 79. For early retirement ages 55 to 61, the A/E ratio decreased from 1.70 to 1.31 and for normal retirement ages 62 to 79, the A/E ratio decreased from 1.63 to 1.19.

Age 57 Plan (Plans I and M)

The following table shows the experience of Age 57 Plans (plan selections Ch96-57/10 Mandated and Ch96-Tier IV Mandated), by service based on the age range (57 to 79) and service range (5 to 39) for the period 2012-2021. The actual rate of retirement averaged 10.16% whereas the overall expected rate of retirement averaged 10.77% based on the current assumptions and 10.56% based on the proposed assumptions. This resulted in an increase in the A/E ratio from 0.94 to 0.96.

Age 55 and 25 Plan (Plan K)

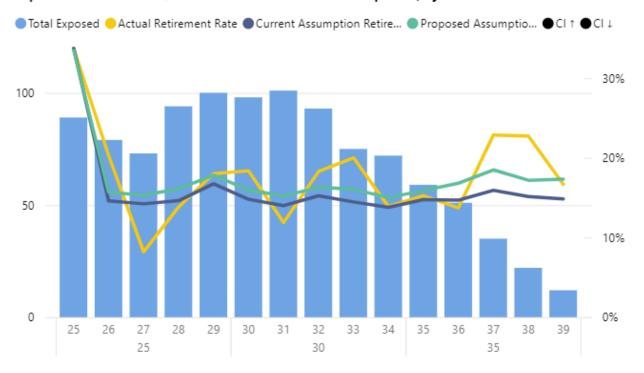

Due to the limited amount of exposures for the Age 55 and 25 Plan (Plan K), we also included other plans that require 25 years of service for retirement. These plans are Plan H: Ch96 – Tier IV, Plan L: Special Officers (no age requirement), Plan N: Ch96 – Tier IV Mandated Physically Taxing (age 50 minimum requirement) and Plan W: Ch96 – Tier IV Physically Taxing (age 50 minimum requirement).

The following table shows the experience of these plans by service based on the age range (55 to 69) and service range (25 to 39) for the period 2012 – 2021. The actual rate of retirement averaged 17.66% whereas the overall expected rate of retirement averaged 16.42% based on the current assumptions and 17.64% based on the proposed assumptions.

Retirement Rate - Actual, Expected, and Ratio; by Age

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

Retirement

Summary

Milliman

In total, the proposed rates of retirement have increased the anticipated number of retirements due to higher assumptions proposed for members with at least 20 years of service, which increase the number of members retiring with a 2% benefit accrual. We believe this would lead to higher plan liabilities. This will be offset by lower assumptions for members retiring with less than 10 years of service. The actual impact will depend on the demographics of the active membership.

Assumption Tables

The following table shows the current assumptions.

NEW YORK CITY BOARD OF EDUCATION RETIREMENT SYSTEM CURRENT PROBABILITIES OF SERVICE RETIREMENT

³ Age 55 rates apply to ages below 55, if applicable

Milliman Section III - BERS

ection III - BERS Disability

Disability

Current ordinary disability assumptions vary by age and gender but do not apply during the 10-year eligibility service period. Furthermore, an additional rate applies to accidental disability during all service periods. Both ordinary and accidental disability benefits are equal to 1/60 times the final average salary for each year of service accrued but no less than 1/3 of the member's final average salary. The benefit is payable during the lifetime of the member, whether or not optional forms of payment are selected. For members who have accrued at least 20 years of service, the service retirement benefit is greater than the disability retirement benefit if the member has met the conditions for an unreduced retirement benefit.

Due to this fact, rates or ordinary disability were determined excluding the experience for members eligible for unreduced retirement and the 2% benefit accrual formula. However, there were still ordinary disability retirements recorded even after attaining this threshold. Therefore, we propose to apply 50% of the rates of ordinary disability apply upon attainment of age 62 and completion of 20 years of service or other criteria to receive an unreduced retirement benefit that varies by Plan (57 and 20 for Plans I and M, 55 and 25 for Plan K, etc.). If eligible for early retirement, we propose that the greater of the early retirement benefit and the ordinary disability retirement be valued.

In addition, the rates of ordinary disability would not apply during the 10-year eligibility service period.

In performing the experience analysis, it is necessary to reassign disability retirement codes retroactively to reflect the eventual approval of a disability retirement. Members with a disability code in a given year had all inactive status codes in prior years changed to a disability status code. Adjustments were made as far back as 2012.

It is difficult to determine how future years would impact the experience during the study period as we believe that this type of retroactive adjustment will be required in subsequent iterations of this study. The consequence will be a restatement of the number of disability retirements experienced during this study period, specifically 2019 – 2021.

For this purpose, our analysis reflected years from 2012 – 2019.

Disability

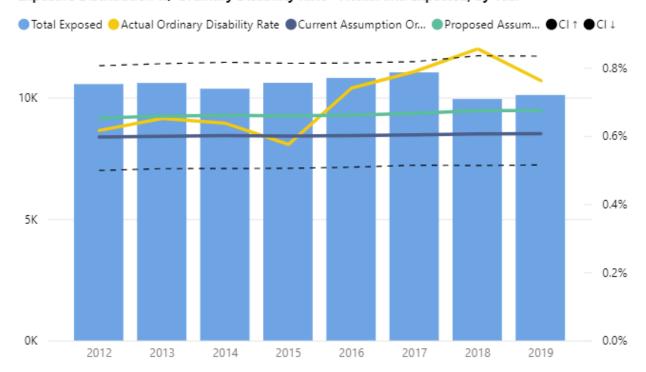

Ordinary Disability

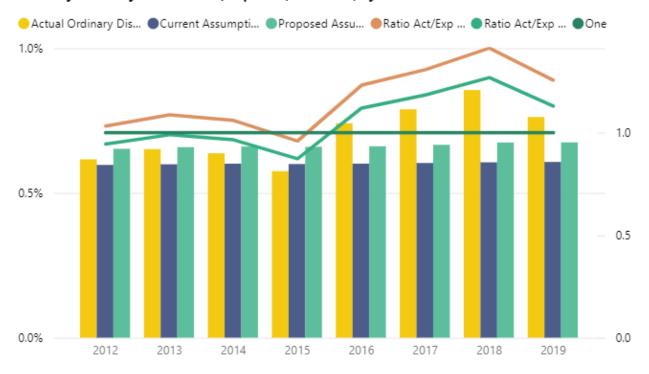

The following table shows the experience for ordinary disability retirement by year, for the age range 30 to 69 and the service range 10 to 29. The actual rate of ordinary disability averaged 0.7025% whereas the overall expected rate of ordinary disability averaged 0.6016% based on the current assumptions and 0.6630% based on the proposed assumptions.

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

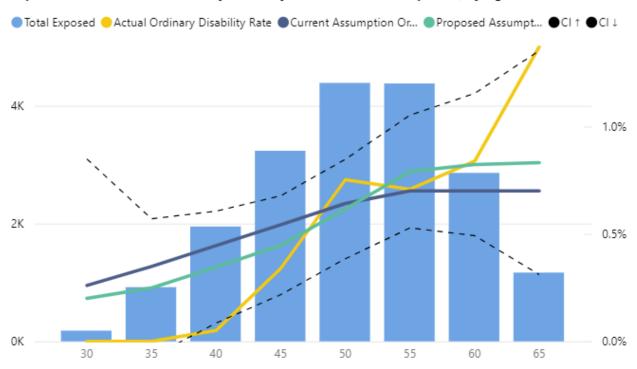

Males

The following table shows the experience of male members by age based on the age range (30 to 69) and service range (10 to 29) for the period 2012 – 2019 for all plans. The actual rate of ordinary disability averaged 0.6080% whereas the overall expected rate of ordinary disability averaged 0.6128% based on the current assumptions and 0.6224% based on the proposed assumptions. This resulted in a decrease in the A/E ratio from 0.99 to 0.98. For members with less than 20 years of service, the A/E ratio decreased from 1.11 to 1.07 and for members with at least 20 years of service, the A/E ratio increased from 0.77 to 0.79.

Ordinary Disability Rate - Actual, Expected, and Ratio; by Age

Part II Experience Study Report - TRS and BERS New York City Retirement Systems

Milliman

Section III - BERS Disability

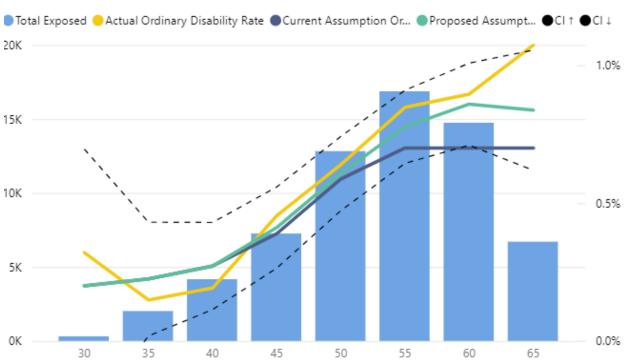

Females

The following table shows the experience of female members by age based on the age range (30 to 69) and service range (10 to 29) for the period 2012 - 2019 for all plans. The actual rate of ordinary disability averaged 0.7302% whereas the overall expected rate of ordinary disability averaged 0.5983% based on the current assumptions and 0.6750% based on the proposed assumptions. This resulted in a decrease in the A/E ratio from 1.22 to 1.08. For members with less than 20 years of service, the A/E ratio decreased from 1.30 to 1.11 and for members with at least 20 years of service, the A/E ratio increased from 0.91 to 0.95.

Ordinary Disability Rate - Actual, Expected, and Ratio; by Age

Summary

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

Milliman Section III - BERS Disability

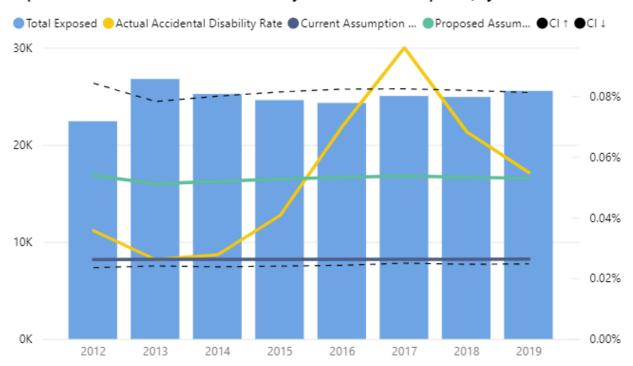

Retirement eligibility and the change in the benefit accrual rate upon completing 20 years of service have a significant impact on the number of members who apply for disability retirement. By reducing rates of ordinary disability retirement at these criteria, we believe it will increase plan liabilities. Furthermore, increasing the rates of ordinary disability for other members, albeit slightly, will also result in higher plan liabilities.

Accidental Disability

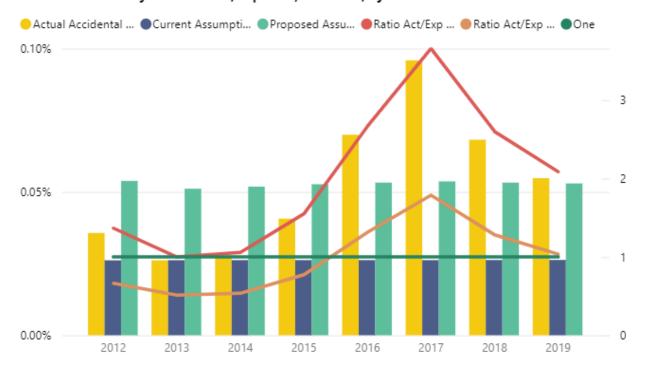

The current accidental assumption varies by gender. The proposed assumption also varies by gender, but also varies by age. The following charts show the experience for accidental disability retirement by year for the age range 25 to 69 and for the service range 0 to 34. The actual rate of accidental disability averaged 0.0523% whereas the overall expected rate of accidental disability averaged 0.0262% based on the current assumptions and 0.0528% based on the proposed assumptions.

Accidental Disability Rate - Actual, Expected, and Ratio; by Year

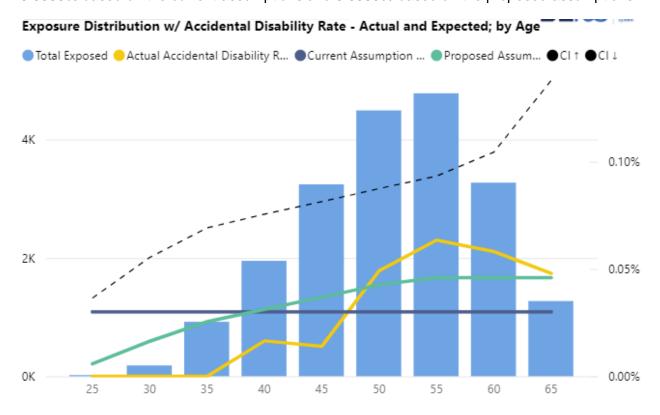

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

Section III - BERS

Disability

Males

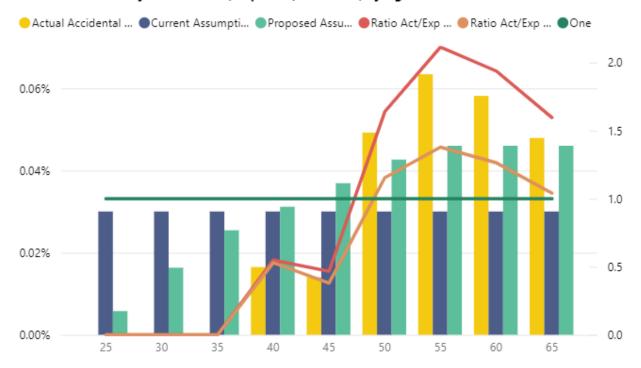

The following charts show the experience of male members for accidental disability retirement by year for the age range 25 to 69 and for the service range 0 to 34. The actual rate of accidental disability averaged 0.0312% whereas the overall expected rate of accidental disability averaged 0.0300% based on the current assumptions and 0.0355% based on the proposed assumptions.

Milliman Section III - BERS

Disability

Accidental Disability Rate - Actual, Expected, and Ratio; by Age

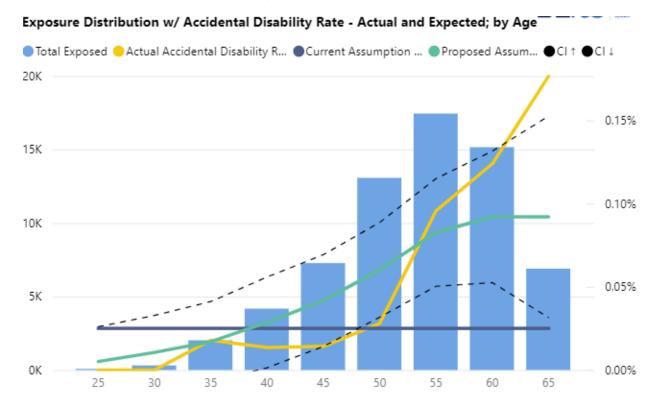

Section III - BERS

Disability

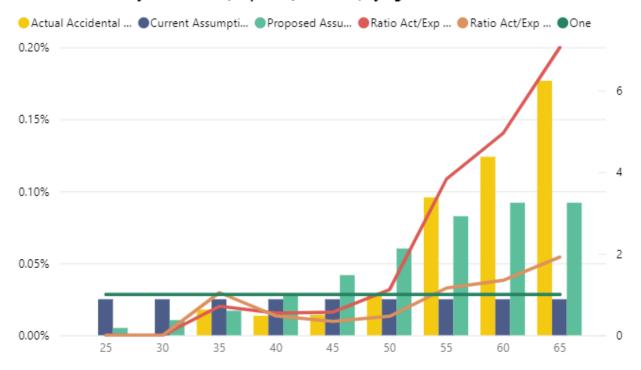

Females

The following charts show the experience of female members for accidental disability retirement by year for the age range 25 to 69 and for the service range 0 to 34. The actual rate of accidental disability averaged 0.0590% whereas the overall expected rate of accidental disability averaged 0.0250% based on the current assumptions and 0.0583% based on the proposed assumptions.

Section III - BERS

Accidental Disability Rate - Actual, Expected, and Ratio; by Age

Summary

The proposed rates have increased the anticipated number of accidental disability retirements, which will result in an increase in plan liabilities.

Assumption Tables

The following table shows the current assumptions.

NEW YORK CITY BOARD OF EDUCATION RETIREMENT SYSTEM CURRENT PROBABILITIES OF DISABILITY RETIREMENT

Greater of disability benefit and retirement benefit is valued if eligible for early or service

Basic Plan (Plan F): Age 62 and 20 years of service

Age 57 Plan (Plans I&M): Age 57 and 20 years of service

Tier 6 (Plan R): Age 63 and 20 years of service

55/27 (Plans P&Q): Age 62 and 20 years of service or Age 55 and 27 years of service

55/25 (Plans K&H): Age 62 and 20 years of service or Age 55 and 25 years of service

Physically Taxing Plans (Plans N&W): Age 62 and 20 years of service or Age 50 and 25 years of service

 $^{^{1}}$ retirement

 $^{^{\}rm 2}$ No rates of ordinary disability apply prior to completion of 10 years of service

³ At attainment of the following age/service combinations, multiply rates above by 50%:

Pre-retirement Death

Plan codes excluded in the analysis of other contingencies are part of the analysis of preretirement death.

Mortality assumptions involve two components: a base table and a mortality improvement scale. The mortality improvement scale adjusts the mortality rates of the base table to reflect that generally rates of mortality are anticipated to improve over time.

The Society of Actuaries (SOA) has published mortality improvement scales (MP scales) each year from 2014 to 2021. In the last several actuarial valuations, OA has used the mortality improvement scale that coincides with the valuation date. For example, OA used the MP-2020 scale in its June 30, 2020 lag actuarial valuation. In this analysis, we used the most recent improvement scale (MP-2021) published by the SOA as of the date of this analysis. Please note that the SOA has not published an updated MP scale due to the pandemic.

The SOA MP-2021 improvement scale is based on data through 2019 (before the onset of Covid) from the Social Security Administration (SSA). Even though the aggregate (for all ages) long-term trend has been towards mortality improvements, this is not always the case for each age. Therefore, there are situations where the expected mortality rate in a later year is higher than base rate.

There is much discussion in the actuarial profession and among retirement systems about the development of mortality tables and treatment of excess deaths due to the Covid pandemic, which occurred in 2020 – 2022. The analysis to develop our recommendations exclude the mortality experience of members during the pandemic and reflect the experience from 2012 - 2019.

In this study the base table of the current assumption corresponds to the year 2012; expected mortality rates in future years are obtained from the base table and the MP-2021 scale. For example, the 2017 (July 1, 2016 – June 30, 2017) mortality rates are derived from the base table (2012) adjusted with four years of improvements until 2016. This method links mortality rates across the years and, consequently, allows mortality comparisons from one year to another.

For the proposed assumption, proposed rates were initially determined as of the mid-year of the study period or fiscal year 2016. MP-2021 was then used to adjust those rates to earlier and later years. The proposed mortality rates shown in the following section have been adjusted to reflect a base year of 2019. We recommend that MP-2021 continue to be used to reflect mortality improvements both before and after the measurement date.

In reviewing the current assumption, we compared the actual experience to published tables from the SOA. The most recent tables published by the SOA reflected experience for public plan retirement systems separated into Teachers (PubT), General employees (PubG) and Public Safety (PubS) members. Adjustments were made to the standard SOA tables to match the experience of the system or the current tables, and for consistency with recommended postretirement mortality tables, to determine if the SOA tables provided a better fit.

Ordinary Death

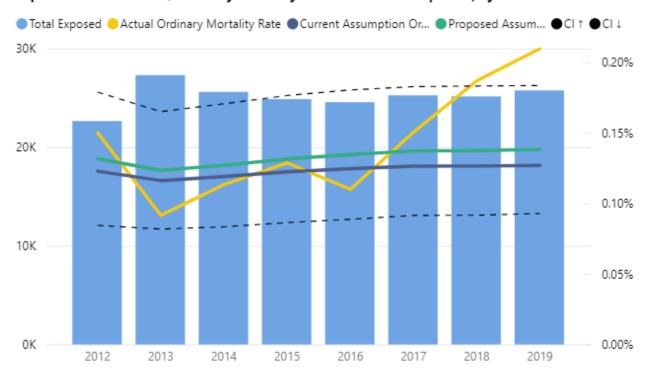

For BERS, we compared the experience to PubG tables without further adjustments. We propose to use the PubG table, which is consistent with the proposed healthy annuitant mortality table.

The following tables show the experience of ordinary death by year, for the age range (20 to 69) during the period 2012 – 2019 based on the current and proposed assumptions for both males and females combined. The A/E ratio decreased from 1.16 to 1.07.

This work product was prepared solely for New York City Comptroller's Office for the purposes described herein and may not be appropriate to use for other purposes. Milliman does not intend to benefit and assumes no duty or liability to other parties who receive this work.

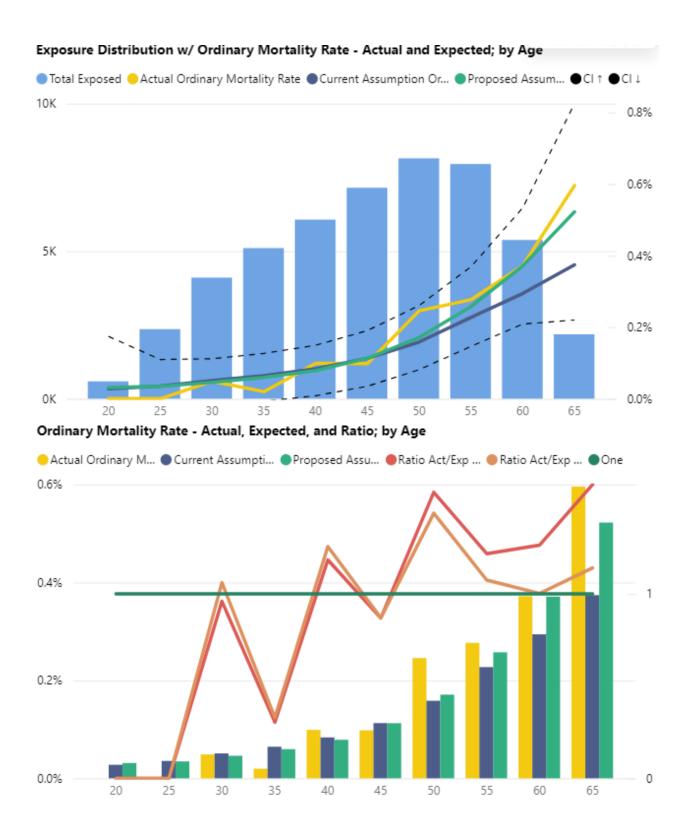

The following section displays results by gender.

Section III - BERS

Males

The following charts show the experience of ordinary death by age band, for the age range (20 to 69) during the period 2012 - 2019 based on the current and proposed assumptions. The A/E ratio decreased from 1.23 to 1.08. Please note that the charts by age are based on 5-year brackets. For example, the age bracket 45 should be interpreted as the interval 45 - 49.

Ordinary Mortality Rate - Actual, Expected, and Ratio; by Age

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

262

This work product was prepared solely for New York City Comptroller's Office for the purposes described herein and may not be appropriate to use for other purposes. Milliman does not intend to benefit and assumes no duty or liability to other parties who receive this work.

Section III – BERS Pre-retirement Death

Summary

Milliman

The proposed assumption increased the anticipated number of deaths occurring prior to retirement, which will result in a decrease in plan liabilities.

Assumption Tables

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

Postretirement Mortality

In addition to gender, the post-retirement mortality assumption depends on the type of inactive member:

- 1) Service Retirees
- 2) Disabled Retirees
- 3) Contingent Beneficiaries

The MEST contains all retirees on one page and beneficiaries on another page. On the retiree page, the experience can be examined by status to review disabled retirees versus service retirees. Service retirees include members who have commenced their pension benefit from a terminated vested status in addition to members who have retired from active status. There is a separate MEST containing the postretirement mortality experience of members across all NYCRS systems, which allowed us to review experience and develop proposed assumptions over multiple systems where it was advantageous to do so.

There is much discussion in the actuarial profession and among retirement systems about the development of mortality tables and treatment of excess deaths due to the Covid pandemic, which occurred in 2020 – 2022. The analysis to develop our recommendations excludes the mortality experience of members during the pandemic and reflects the experience from 2015 - 2019. Experience prior to 2015 was excluded as benefit amounts were not available in the historical database prior to this period.

Most mortality studies have found that higher benefits are positively correlated with smaller mortality rates and longer life expectancy. Accordingly, the OA utilizes adjustment factors to convert post-retirement mortality weighted by headcounts to post-retirement mortality weighted by benefit amounts. The current assumption adjustment factors used by the OA are:

| Post-Retirement Mortality Adjustment Factor To Convert from Headcount-Weighted to Amount-Weighted | | | | | |
|---|-------|-------|--|--|--|
| Males Females | | | | | |
| Service Retiree | 0.980 | 0.980 | | | |
| Disabled Retiree | 0.980 | 0.980 | | | |
| Contingent Beneficiary | 0.890 | 0.951 | | | |

Mortality assumptions involve two components: a base table and a mortality improvement scale. The mortality improvement scale adjusts the mortality rates of the base table to reflect that generally rates of mortality are anticipated to improve over time. As noted in the pre-retirement death section, we used the most recent improvement scale (MP-2021) published by the SOA as of the date of this analysis. Please note that the SOA has not published an updated MP scale due to the pandemic.

In this study the base table of the current assumption corresponds to the year 2012; expected mortality rates in future years are obtained from the base table and the MP-2021 scale. For example, the 2017 (July 1, 2016 – June 30, 2017) mortality rates are derived from the base table (2012) adjusted with four years of improvements until 2016. This method links mortality rates across the years and, consequently, allows mortality comparisons from one year to another.

For the proposed assumption, proposed rates were initially determined as of the mid-year of the study period or fiscal year 2017. MP-2021 was then used to adjust those rates to earlier and later years. The proposed mortality rates shown in the following section have been adjusted to reflect a base year of 2019. We recommend that MP-2021 continue to be used to reflect mortality improvements both before and after the measurement date.

In reviewing the current assumption, we compared the actual experience to published tables from the SOA. The most recent tables published by the SOA reflected experience for public plan retirement systems separated into Teachers (PubT), General employees (PubG) and Public Safety (PubS) members. The SOA publishes versions of each of these tables where the mortality rates are weighted by the amount of the pension benefit ("amount-weighted") or weighted by the number of members (headcount-weighted). We compared the amount-weighted experience to the amount-weighted SOA table and the headcount-weighted experience to the headcount-weighted SOA table. Adjustments were made to the applicable standard SOA tables to match the experience of the system to determine if the SOA tables provided a better statistical fit to the experience. For BERS, we used the PubG tables in our analysis.

The SOA combined the experience of teachers and general employees in developing disability annuity mortality tables. Due to lack of credibility, a relatively lower disability incidence rate and consistency with the SOA tables, we combined the experience of TRS, BERS and NYCERS (general, sanitation, transit, and TBTA) in proposing a recommended assumption.

The SOA also combined the experience of all contingent beneficiaries (teachers, general employees and public safety members) into a single table. We combined the experience of all NYCRS systems (TRS, BERS, NYCERS, POLICE and FIRE) in proposing a recommended assumption. The contingent survivor assumption would apply upon the death of the member. While both the member and contingent survivor are both alive, we propose the healthy annuitant mortality table apply.

In the actuarial valuation of pension benefits, we recommend that amount-weighted mortality rates be used. Headcount-weighted mortality rates may be used for other purposes, such as a retiree medical valuation.

Postretirement Mortality – Service Retirees

For BERS, we propose the PubG table without further adjustment which increases the assumed number of deaths. Separate tables exist on a headcount-weighted and amount-weighted basis.

The following charts show postretirement mortality experience on a headcount-weighted basis by year for the age range (60 to 104) during the period 2015 – 2019 for both males and females combined on the current and proposed assumptions. The A/E decreased from 1.04 to 0.90. Due to the significantly lower number of deaths recorded in 2015, we excluded this year in our analysis. Excluding this year, the A/E decreased from 1.19 to 1.02.

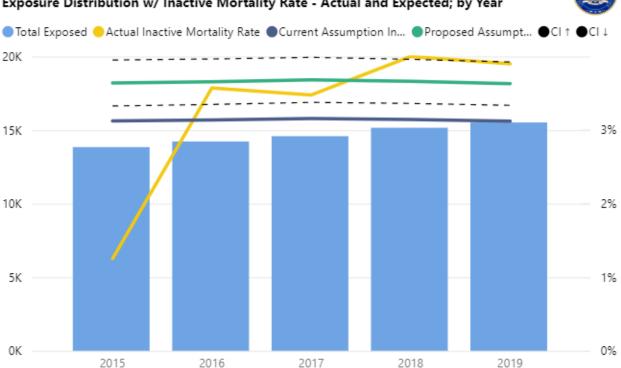

Current Assumption – Headcount-weighted

| Plan Year | Actual Inactive Deaths | Expected Inactive Deaths | Total Exposed | Actual Inactive Mortality Rate | Current Assumption Inactive Mortality | Act | atio /Exp ctive tality |

Pension Benefit Distribution w/ Inactive Mortality Rate - Actual and Expected; by Year

Inactive Mortality Rate - Actual, Expected, and Ratio; by Year

Actual vs. Expected - Inactive Mortality Proposed w/ Benefit Bubbles; by Year

The following section displays results by gender.

Service Retirees - Males

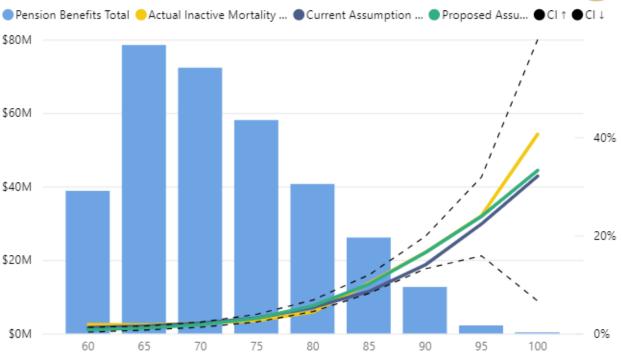

The following charts show postretirement mortality experience on an amount-weighted basis by age band for the age range (60 to 104) during the period 2016 – 2019 for males on the current and proposed assumptions. The A/E decreased from 1.05 to 1.03.

Please note that the charts by age are based on 5-year brackets. For example, the age bracket 75 should be interpreted as the interval 75 - 79.

Inactive Mortality Rate - Actual, Expected, and Ratio; by Age

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

278

Milliman

Service Retirees - Females

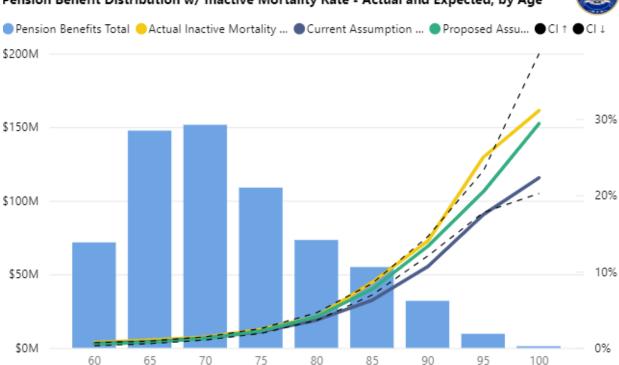

The following charts show postretirement mortality experience on an amount-weighted basis by age band for the age range (60 to 104) during the period 2016 – 2019 for females on the current and proposed assumptions. The A/E decreased from 1.26 to 1.12.

Please note that the charts by age are based on 5-year brackets. For example, the age bracket 75 should be interpreted as the interval 75 – 79.

Inactive Mortality Rate - Actual, Expected, and Ratio; by Age

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

282

Section III - BERS

Postretirement Mortality

Summary

We have proposed new assumptions consistent with industry standards to better reflect recent non-pandemic experience. In total, the proposed mortality tables are anticipated to increase plan liabilities for younger retirement ages up to about age 70 for males and age 60 for females, and then anticipated to decrease plan liabilities for older retirement ages. In total, the proposed mortality tables are anticipated to decrease plan liabilities.

Assumption Tables

The following table shows the current assumptions.

Postretirement Mortality – Disability Retirees

The SOA combined the experience of teachers and general employees in developing disability annuity mortality tables. Due to lack of credibility, a relatively lower disability incidence rate and consistency with the SOA tables, we combined the experience of TRS, BERS and NYCERS (general, sanitation, transit, and TBTA) in proposing a recommended assumption. We propose to use the PUB disabled annuitant non-public safety mortality table, without any adjustment. Separate tables exist on a headcount-weighted and amount-weighted basis.

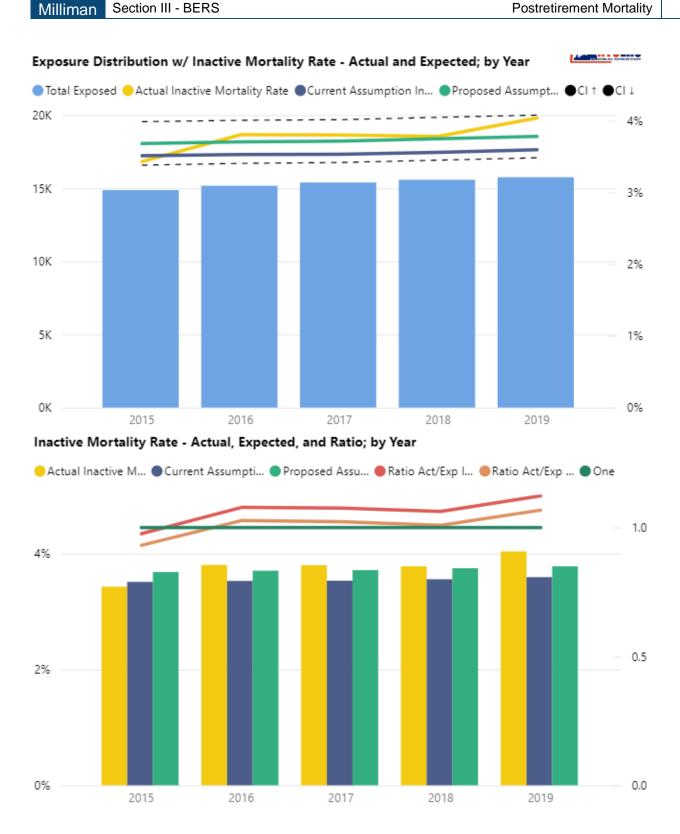

The following charts show postretirement mortality experience on a headcount-weighted basis by year for the age range (50 to 99) during the period 2015 – 2019 for both males and females combined on the current and proposed assumptions for all non-public safety members of NYCRS. The A/E decreased from 1.06 to 1.01 and decreased from 1.12 to 0.93 for only BERS.

Current Assumption - Headcount-weighted

| Plan Year | Actual Inactive Deaths | Expected Inactive Deaths | Total Exposed | Actual Inactive Mortality Rate | Current Assumption Inactive Mortality | Act. | itio /Exp ctive tality |

Pension Benefit Distribution w/ Inactive Mortality Rate - Actual and Expected; by Year

Inactive Mortality Rate - Actual, Expected, and Ratio; by Year

The following section displays results by gender.

Milliman

Disabled Retirees - Males

The following charts show postretirement mortality experience on an amount-weighted basis by age band for the age range (50 to 99) during the period 2015 – 2019 for males on the current and proposed assumptions for all non-public safety members of NYCRS. The A/E decreased from 1.01 to 0.99 and decreased from 1.36 to 1.13 for only BERS.

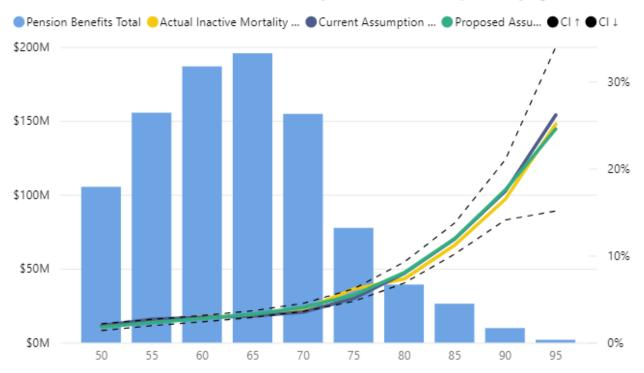

Please note that the charts by age are based on 5-year brackets. For example, the age bracket 75 should be interpreted as the interval 75 - 79.

Inactive Mortality Rate - Actual, Expected, and Ratio; by Age

Headcount-weighted

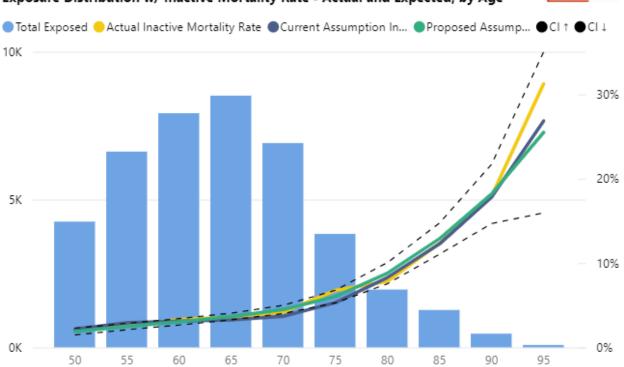

The following charts show postretirement mortality experience on a headcount-weighted basis by age band for the age range (50 to 99) during the period 2015 – 2019 for males on the current and proposed assumptions for all non-public safety members of NYCRS. The A/E decreased from 1.06 to 1.00 and decreased from 1.33 to 1.04 for only BERS.

Postretirement Mortality - Contingent Beneficiaries

The SOA combined the experience of all contingent beneficiaries of teachers, general employees and public safety members in developing contingent survivor annuity mortality tables. We combined the experience of all NYCRS systems (TRS, BERS, NYCERS, POLICE and FIRE) in proposing a recommended assumption. We propose to use the PUB contingent survivor annuitant mortality tables, multiplied by adjustment factors. Separate tables exist on a headcount-weighted and amount-weighted basis in addition to gender.

For males, the proposed adjustment factors are 125% for amount-weighted and 120% for headcount-weighted. For females, the proposed adjustment factors are 120% for amount-weighted and 108% for headcount-weighted.

The contingent survivor assumption would apply upon the death of the member. While both the member and contingent survivor are both alive, we propose the healthy annuitant mortality table apply.

The following charts show postretirement mortality experience on a headcount-weighted basis by year for the age range (60 to 104) during the period 2015 – 2019 for both males and females combined on the current and proposed assumptions for all members of NYCRS. The A/E decreased from 1.12 to 1.00 and decreased from 0.96 to 0.86 for only BERS.

Beneficiary Mortality Rate - Actual, Expected, and Ratio; by Age

Part II Experience Study Report – TRS and BERS New York City Retirement Systems

320

This work product was prepared solely for New York City Comptroller's Office for the purposes described herein and may not be appropriate to use for other purposes. Milliman does not intend to benefit and assumes no duty or liability to other parties who receive this work.

Contingent Beneficiaries - Females

The following charts show postretirement mortality experience on an amount-weighted basis by age band for the age range (60 to 104) during the period 2015 – 2019 for females on the current and proposed assumptions for all members of NYCRS. The A/E decreased from 1.16 to 0.96 and decreased from 1.13 to 0.95 for only BERS.

Please note that the charts by age are based on 5-year brackets. For example, the age bracket 75 should be interpreted as the interval 75 - 79.

0%

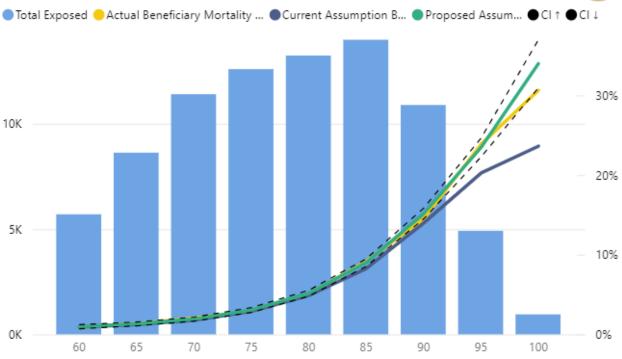

Headcount-weighted

The following charts show postretirement mortality experience on a headcount-weighted basis by age band for the age range (60 to 104) during the period 2015 – 2019 for females on the current and proposed assumptions for all members of NYCRS. The A/E decreased from 1.10 to 0.99 and decreased from 0.99 to 0.90 for only BERS.

Summary

We have proposed new assumptions consistent with industry standards. In total, the proposed mortality tables are anticipated to decrease plan liabilities.

Assumption Tables

The following table shows the current assumptions.

NEW YORK CITY BOARD OF EDUCATION RETIREMENT SYSTEM CURRENT PROBABILITIES OF BENEFICIARY MORTALITY BASE TABLE

| Age | Males | Females | Age | Males | Females |
|-----|---------|---------|-----|----------|----------|
