About DCAS

The Department of Citywide Administrative Services (DCAS) provides effective shared services to support the operations of New York City government. Its commitment to equity, effectiveness, and sustainability guides its work with city agencies on recruiting, hiring, and training employees; providing facilities management for 55 public buildings; acquiring, selling, and leasing city property; purchasing more than \$1 billion in supplies and equipment each year; and implementing conservation and safety programs throughout the city's facilities and vehicle fleet.

About DEM

The DCAS Division of Energy Management is at the forefront of the City's energy conservation and sustainability efforts. It oversees more than 10,000 utility accounts for City government agencies across 4,000 public buildings. It implements creative solutions to reduce energy consumption, promote energy efficiency in public buildings, and to generate clean energy on City-owned properties. The division manages a \$700 million annual energy supply budget and a \$3 billion 10-year capital budget to develop and implement programs to achieve the City's One City: Built to Last strategy of an 80% reduction of greenhouse gas emissions and carbon neutrality by 2050.

This report was prepared in compliance with the requirements of Local Law 24 of 2016 (LL24). Under LL24, the Department of Citywide Administrative Services (DCAS) is required to assess the solar photovoltaic (PV) potential of all City-owned buildings over 10,000 gross square feet once every two years. Special focus is given to identifying and quantifying potential capacity at solar-ready buildings, which are defined as buildings that have roofs that are no more than 10 years old and are in fair or good condition. The 2020 Solar-Readiness Assessment is the third biennial assessment pursuant to LL24 and data represented herein is current as of December 31, 2020.

The City of New York is required by Local Law 97 of 2019 (LL97) to reduce green-house gas (GHG) emissions from City government operations 40% by 2025 and 50% by 2030 compared to a Fiscal Year 2006 baseline. As of the end of Fiscal Year 2019, the most recent year for which the Mayor's Office of Climate and Sustainability has published the annual Greenhouse Gas Inventory, the City had reduced GHG emissions from City government operations by 23%.¹ Installing solar PV power generation capacity is a key component of the City's GHG reduction strategy, and the City has set an aggressive target to install 100 megawatts (MW) of solar PV at City facilities by 2025.

The City has reached a critical inflection point in its pursuit of the 100 MW by 2025 solar installation goal. Following an initial period of rapid growth, in which the City increased installed solar PV capacity ten-fold—from less than 1 MW in 2014 to more than 10 MW by 2018—the City's solar development efforts have faced challenges achieving greater scale over the past two years. The City has made major strides in addressing these challenges, however, and is now poised to undertake a new wave of rapid growth that will put the City on track to achieve 100 MW by 2025. See **Table 1** in section [Solar Progress](#) for more details on how DCAS has addressed challenges to solar PV development.

¹ The City had previously achieved GHG reductions as high as 28% relative to the FY 2006 base year. This high mark was achieved in FY2017, nearly reaching the City's prior goal for reducing City government emissions 30% by 2017. Emissions increases since 2017 are attributed largely to changes in weather and increases in the carbon intensity of the electric grid.

For over a decade, the City of New York has positioned itself as a global leader in sustainability policy and action. Through the implementation of groundbreaking legislation and policy focused on supporting clean energy generation and improving energy efficiency across sectors, the City of New York has become a model for communities across the nation and around the world. The City's efforts have been driven by its vision to achieve carbon neutrality by 2050.² Since originally establishing this goal in 2014, the City of New York has renewed its efforts to address climate change with even more ambitious commitments. In line with the consensus needed to avoid the worst impacts of climate change, Mayor de Blasio joined with a multitude of cities and states across the United States to adopt the goals of the Paris Climate Agreement through Executive Order 26.

As such, New York is accelerating its carbon neutrality efforts to achieve greater reductions in the nearer term. Additionally, the mayor has committed City government to install 100 MW of solar at City facilities by 2025. The past two years have seen additional stacking of mandates beginning with LL97 and the Climate Mobilization Act. LL97 requires City government to go further and faster than the private sector. City government is required to achieve a 40% reduction by Fiscal Year 2025 and a 50% reduction by Fiscal Year 2030 from a Fiscal Year 2006 baseline. In contrast, full private sector compliance is expected to yield approximately a 40% reduction by 2030 from a 2005 baseline. Since 2019, the City has also committed to acquiring 100% clean electricity by 2025. The energy consumed by buildings is responsible for about two-thirds of New York City's GHG emissions and the City's facilities (stationary assets) constitute over 90% of City government related emissions and so, the City has committed to leading the way in its own buildings.

DCAS and its Division of Energy Management serve as the hub for energy management and emissions reductions for the City government portfolio and has focused its efforts and investments on the City's various stationary assets that include buildings, streetlights and traffic signals, and water supply and solid waste facilities. To ensure that City agencies are equipped with the resources that they need to succeed, DCAS is working

² All GHG reductions are from 2005 levels.

with agencies to identify and implement projects and actions that they will have to undertake to meet the City's energy and emissions goals. DCAS provides agency partners with Technical Guidance, Strategic Planning, Contracting, Energy Management Professionals, Training and Behavioral Change, Enhanced Operations and Maintenance, Energy Efficiency Interventions, Distributed Clean Energy Generation, and Utility Services.

Since efforts to scale up solar PV began in 2014, installations at City-owned facilities have grown from less than 1 MW to over 12 MW in 2020, with 41 additional MW of solar PV projects actively in construction or in development as of December 31, 2020. Despite this exponential growth, several barriers still exist to achieving 100 MW by 2025. In its 2018 solar-readiness report, DCAS found that approximately 30 MW across over 400 facilities were solar-ready and over 1,400 facilities were categorized as not solar-ready. Since 2018, DCAS has been actively working with its agency partners to identify additional solar-ready sites and begin development of identified sites. The active project portfolio size has grown from approximately 18 MW in 2018 to 41 MW in 2020.

This report, which was prepared in compliance with the requirements of LL24, assesses the solar PV potential of all City-owned buildings over 10,000 gross square feet as of the end of the calendar year 2020.³ The 2020 Solar-Readiness Assessment is the third biennial assessment pursuant to LL24. This report also highlights strategic actions and recent accomplishments that have advanced the City's progress toward meeting the 100 MW by 2025 goal.

³ DCAS continually updates its solar deployment figures on the [DEM homepage](#).

The City has continued to expand its commitment to environmental justice and a clean and healthy environment for all. In 2017, the City passed Local Law 60 of 2017 (LL60) and Local Law 64 of 2017 (LL64) requiring the City to, among other things, define environmental justice areas, agencies' responsibilities, and recommendations for greater utilization of renewable energy in disadvantaged communities and study investments made in the utilization of renewable energy in environmental justice areas. In 2019, the City passed the Climate Mobilization Act and local laws concerning clean energy, including Local Law 92 of 2019 (LL92), Local Law 94 of 2019 (LL94), Local Law 181 of 2019 (LL181), and Local Law 183 of 2019 (LL183). Each local law is part of an overall strategy to equitably decarbonize the city by 2050.

New York City (NYC) Solar Policy

One City Built to Last

New York City set the goal of installing 100 MW of solar PV at City-owned facilities in *One City Built to Last*, the ambitious framework for achieving an 80% reduction in GHG emissions by 2050, through transforming New York City's buildings. At the time of publication in 2014, the City reported a total installed capacity at City facilities of only 0.7 MW. As of 2020, the City's portfolio grew to 12 MW, with 41 additional MW of solar PV projects actively in construction or in development.

Local Law 24 of 2016

The City passed LL24 to enhance public awareness of the City's efforts to install 100 MW of solar by 2025. Under LL24, DCAS is required to assess the solar PV potential of all City-owned buildings over 10,000 gross square feet once every two years. Special focus is given to identifying and quantifying potential capacity at solar-ready buildings, which are defined as buildings that have roofs that are no more than 10 years old and in fair or good condition. This 2020 Solar-Readiness Assessment is the third biennial assessment pursuant to LL24.

Environmental Justice

Building off the *City's One New York: The Plan for a Strong and Just City* published in 2015, the City passed two local laws in 2017 designed to assess the distribution of environmental benefits and burdens and consequent health impacts in New York City, and develop an environmental justice (EJ) plan to advance EJ goals and more fully involve communities in environmental decision-making.

Local Law 60 of 2017

LL60 requires the City to conduct a comprehensive EJ study identifying the locations and boundaries of EJ areas within the City, describing “environmental justice concerns” affecting the city, and identifying data, studies, programs, and other resources that are available and that may be used to promote “environmental justice concerns.”

Local Law 64 of 2017

LL64 requires the establishment of an EJ Interagency Working Group (IWG) and EJ Advisory Board. It requires the IWG to develop a comprehensive Environmental Justice Plan that provides guidance on incorporating EJ concerns into City decision-making, identifies possible citywide initiatives for promoting EJ, and provides specific recommendations for City agencies to bring their operations, programs, and projects in line with EJ concerns. The plan must also include recommendations for legislation, policy, budget initiatives, and other measures to address environmental justice concerns which could include, among other things, increased utilization of renewable energy.

Climate Mobilization Act

The Climate Mobilization Act is a package of laws passed by the New York City Council in 2019. LL97, the building emissions law, is the centerpiece of the package. The package includes other important laws related to reducing greenhouse gas emissions, including the establishment of a Property Assessed Clean Energy financing program, sustainable roofing requirements, and a mandate to assess energy storage potential at City buildings. Specific components of the Climate Mobilization Act that impact the advancement of solar PV and other forms of clean energy are outlined below.

Local Law 97 of 2019

Passed as part of the 2019 Climate Mobilization Act, LL97 requires facilities over 25,000 square feet in size to reduce their emissions by 40% by 2030 and by 80% by 2050. In addition, it requires City government operations to reduce its emissions 40% by 2025 and 50% by 2030. This law is unique and novel in its aim, because it targets existing buildings and requires owners to achieve a GHG cap per square foot based on a building's occupancy group. Other similar laws have been passed worldwide but target only new construction projects.

Local Laws 92 & 94 of 2019

LL92 and LL94 require sustainable roofing systems in new construction, and when existing roofs are expanded or replaced inclusive of the roof decking. A sustainable roofing system is defined as a solar PV system, a green roof, or a combination of both. DCAS anticipates over 40 projects in the next five years which will have to comply with the laws. According to a 2019 Mayor's Office of Climate and Sustainability analysis, LL92 and LL94 are estimated to result in up to 35 MW of new solar capacity annually across public and private buildings.⁴

Local Law 181 of 2019

LL181 requires DCAS to publish a citywide feasibility study in 2021 examining the installation and use of utility-scale energy storage systems. The study will review the existing technologies for storing potential, kinetic, chemical, electromagnetic, thermal, or other types of energy, including compressed air, flywheels, batteries, superconducting magnetic storage, and ice storage. Over the next few years, deploying energy storage in conjunction with the expansion of solar PV will be crucial to achieving the City's sustainability and resiliency goals.

⁴ Mayor's Office of Sustainability, Solar and Green Roofs, Local Laws 92 & 94, 2019, <https://be-exchange.org/wp-content/uploads/2019/10/20191001-LL92.94-Sustainable-Roofs.pdf>

Local Law 183 of 2019

LL183 requires DCAS to publish a citywide feasibility study in 2021 identifying the types of city-owned buildings where solar water heating and thermal energy systems may be appropriate and cost-effective. The results of this study should help inform where solar water heating systems and thermal energy systems are a cost-effective solution to replace or reduce the use of traditional fossil-based heating systems.

Utility Policy

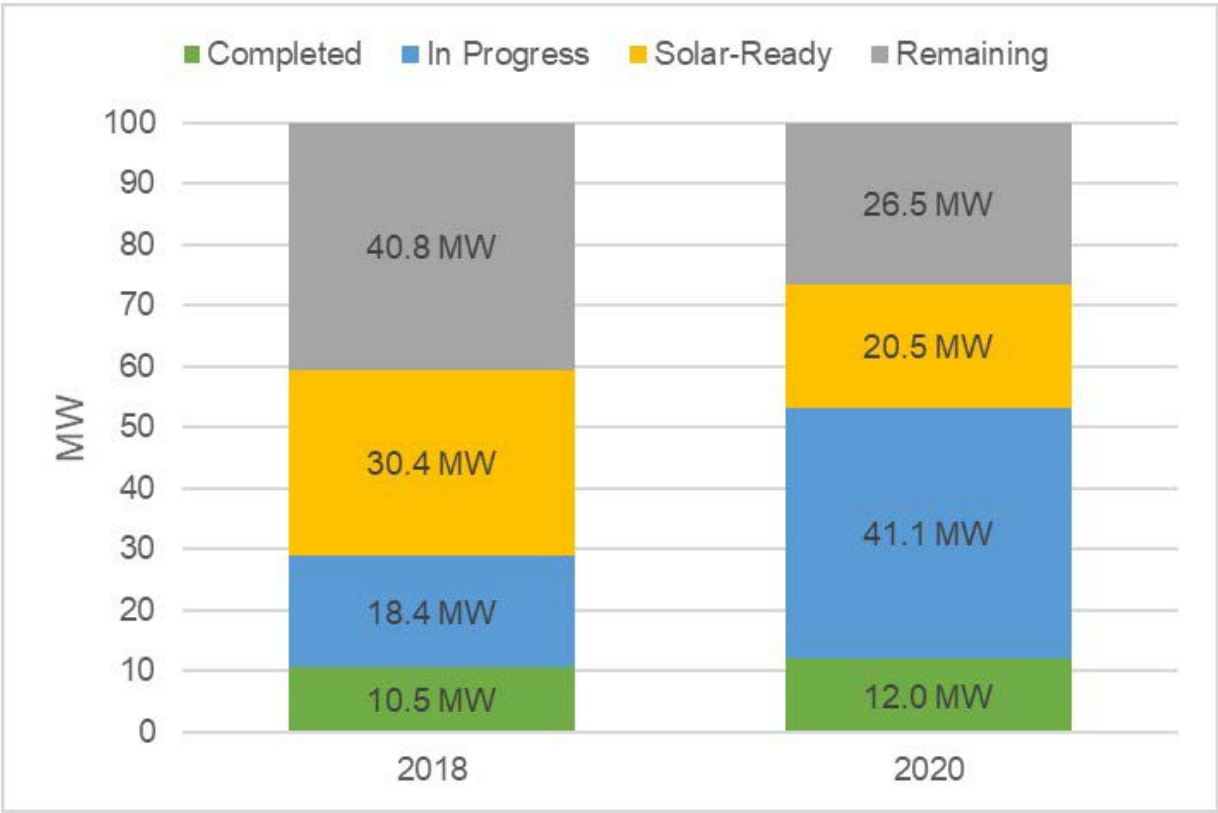

The regulatory landscape for clean energy continues to evolve in New York State. One major development that has occurred over the past several years is a framework to incentivize clean energy and distributed energy resources based on the value that they provide to the electrical system. This framework is known as the Value of Distributed Energy Resources (VDER).

Value of Distributed Energy Resources (VDER)

The New York State Public Service Commission established a mechanism to transition to a new way of compensating distributed energy resources (DER), like solar power. This mechanism, called VDER or the Value Stack, is an alternative to net energy metering, which provides customers who generated excess solar energy with a credit that was worth the full retail rate of a delivered kilowatt-hour (kWh). VDER primarily compensates projects based on the contribution to avoiding utility-based capital investments and the degree to which a project can deliver energy when electric supply is constrained. It also provides compensation related to the avoidance of GHG emissions. The City continues to advocate for equitable and cost-effective ways to increase solar deployment in New York City by reducing costs of grid interconnection and adequately compensating solar and storage based on the benefits they provide to New York City's communities. Future changes in DER compensation may impact cost-benefit evaluations and the locations for development.

As of 2020, the City has installed approximately 12 MW of solar PV capacity across 87 buildings.^{5,6} This solar portfolio is estimated to produce over 13 million kWh annually on average, which is enough to supply the electricity needs of over 3,000 New York City residences. Completed installations are estimated to reduce GHG emissions by more than 3,800 metric tons of carbon dioxide annually. This is the equivalent to taking an estimated 830 cars off the road each year.

Figure 1. Progress Towards 100 MW—2018 vs. 2020

Still there is much work to do. This first portion of solar deployments faced many challenges as the solar industry in the city was still evolving. Challenges primarily manifested in two ways: (1) a challenging construction environment and (2) barriers in deployment approaches. **Table 1** below highlights the various difficulties experienced and measures to mitigate continued risk.

⁵ Completed and In Progress project metrics are as of November 2020.
⁶ Completed project metrics are detailed in the Appendix starting on page 1.

Table 1. Overcoming Challenges to Solar Development

General Challenge Type	Specific Challenge	Mitigation Measure
Complex Construction Environment	Intricate Local Regulatory Landscape: New York City’s dense building stock, stringent health and safety codes, public design requirements, and heavy demand for construction services have led to higher installation costs and longer development timelines for solar PV compared to other regions.	Increasing Collaboration, Expertise, and Efficiency: Since 2018, DCAS has collaborated with the Mayor’s Office of Climate and Sustainability and the Fire Department to develop clear and standard regulations for the safe installation of rooftop PV systems. DCAS DEM has also significantly expanded the capacity of its Clean Energy Team by adding four new staff members who possess combined experience in the solar industry of over 20 years. Additionally, DCAS is developing a process of proactively assessing facilities with roofs that will age out of solar-readiness for potential implementation prior to crossing the 10 year threshold.
Complex Construction Environment	Shortage of Qualified Interested Developers: The complex regulatory environment associated with solar installations, combined with complicated procurement requirements and a booming construction industry, decreased the available pool of qualified firms responding to municipal solicitation.	Increased Outreach: DCAS has strengthened its outreach to solar developers, the National Electrical Contractors Association, and Local Union No. 3 International Brotherhood of Electrical Workers (IBEW) to increase the pool of skilled union labor available to perform solar installations.

General Challenge Type	Specific Challenge	Mitigation Measure
Complex Construction Environment	Shortage of Solar-Ready Buildings: The City has an insufficient supply of solar-ready buildings to reach the 100 MW target by 2025 through rooftop solar alone. Nearly 70% of roofs are older than ten years and therefore unable to host a solar PV system for its 20-year lifespan. Furthermore, buildings deemed solar-ready per the requirements of LL24 may still face obstacles to development, including structural or electrical infrastructure limitations and excessive shading.	Replacing Roofs and Finding New Sites: DCAS has begun partnering with City agencies to co-fund strategic roof replacements in tandem with solar projects. DCAS is also developing large scale projects at City parking lots and infrastructure sites, including Water Resource Recovery Facilities (WRRF). DCAS is considering creative solutions for the non-viable solar-ready facilities, including elevated canopies and other usable non-roof space (ground-mounted and parking canopies).
Complex Construction Environment	Disruptions Due to COVID-19: The City was forced to suspend construction and development of dozens of solar projects between March and July of 2020 due to the Coronavirus Disease 19 (COVID-19) pandemic. The City expects ongoing impacts to the program in 2021.	Perseverance and Creativity: DCAS took advantage of the spring work stoppage to conduct a strategic review of its clean energy portfolio. The review assessed common project development challenges, including site electrical and structural feasibility, permitting and interconnection delays, construction quality, labor relations, and other issues. DCAS has incorporated lessons learned and new practices into its development process to expedite future projects. Construction and development activities restarted in July 2020; since then, through December 2020, DCAS has added more than 1 MW of capacity.

General Challenge Type	Specific Challenge	Mitigation Measure
Deployment Approach	Challenges Adopting Private Sector Delivery Methods to the Public Sector: The City has faced challenges adapting private-sector solar business models—particularly design-build contracting and third-party tax equity financing—to its complex procurement process.	New Contracting Approaches: DCAS’s new Pre-Qualified List (PQL) for General Construction Services includes some of the region’s top solar developers. DCAS is also developing procurements for design, construction, and O&M services. These procurements will facilitate both in-house and public work project development approaches. DCAS is partnering with the Power Authority of the State of New York (NYPA) to develop a multi-site PPA and eliminate tax equity contracting complexities and design-build limitations.

General Challenge Type	Specific Challenge	Mitigation Measure
Deployment Approach	Competing Investment Needs and Project Dependencies: City agencies often have other capital projects that they must appropriately sequence with solar installation. Furthermore, implementation of solar projects often depends on the execution of roof replacements or larger capital projects, with any project delays impacting the timeline for delivering solar.	Supportive New Policies: LL92 and LL94 require installing solar PV systems or green roofs at new buildings and major renovations. DCAS is partnering with agencies to operationalize this policy and support efficient delivery of solar within existing project contexts. DCAS has partnered with the National Renewable Energy Laboratory (NREL) to develop best in class specifications and O&M procedures, as well as is working on an O&M contract to reduce building operators' maintenance concerns.
Deployment Approach	Unique Project Economics: New York City government benefits from low-cost electricity supplied by NYPA, which means that offsetting utility bills doesn't have the same financial return as it might have for private sector entities. Combined with the complex construction environment and the challenges public sector projects face in accessing tax incentives, the economics of public sector solar projects may be less attractive compared to development at private sites or energy efficiency interventions.	Financing Innovation and Economies of Scale: The City and NYPA are partnering on a PPA model that will allow the monetization of federal tax incentives to benefit the City without entering complex agreements with third-party developers.

General Challenge Type	Specific Challenge	Mitigation Measure
Deployment Approach	Workforce Development: Clean energy jobs are vital to the City's Green New Deal goals. Additionally, these jobs are coveted by the City's world-class building trades and by organizations that foster career pathways for economically disadvantaged individuals. However, the City lacked a framework to promote workforce development objectives in project procurements.	New Project Labor Agreement for Solar: In August 2020, the City signed a PLA with the Building and Construction Trades Council of Greater New York (BCTC) and Local Union No. 3 IBEW that will increase the size and skill level of the solar workforce, while fostering inclusive career pathways in clean energy.

This first portion of clean energy projects has provided considerable insight into the specific challenges and complexities associated with deployment of solar PV across the municipal portfolio, as well as the potential opportunities to scale-up project delivery. Working with a broad set of stakeholders to better understand the challenges and opportunities, DCAS has implemented numerous risk mitigation strategies and is prepared to scale up solar installation rates significantly with a strong pipeline of projects through 2022.

DCAS has completed onsite engineering studies at over 100 locations since 2016. The studies include assessments of roof condition, structural systems, electrical service, soil conditions, interconnection requirements, shading potential, and regulatory requirements. These engineering studies are critical in determining each site's feasibility, capacity potential, technology selection, and have led to a series of new projects. In the spring of 2019, DCAS launched construction at several public schools, with installations continuing to ramp up through 2022 at buildings across all five boroughs. In total, as of 2020, there are 41 MW worth of solar projects in progress across 171 buildings.⁷

⁷ In Progress installations are defined as sites with solicitations out awaiting bids or under contract for design and/or construction.

Assessment Process

Figure 2. Example of PV System Model

Proposed layout of a 285 kW solar PV system for the solar-ready property P.S. 36 (R036) in Staten Island, which DCAS created using a PV modeling tool.

To prepare this third assessment of solar-readiness, DCAS collected data on the roof age and condition of over 1,900 City buildings that are operated by 22 City agencies. For every building identified as solar-ready, DCAS utilized a professional-grade solar PV modeling tool to produce a preliminary solar system layout like the one pictured to the left. Each layout utilized standardized equipment specifications and complied with spacing and setback requirements from the NYC Construction Code and Fire Code.

After completing preliminary layouts, DCAS utilized location-specific weather data and shading analyses to yield estimates for installed kilowatt (kW) capacity, annual kWh production, and associated GHG emissions reductions for each solar-ready site. DCAS also reviewed and refined PV system models at solar-ready sites that were identified prior to 2019 to reflect updated equipment standards and current rooftop conditions.

DCAS also collaborated with key agency partners to obtain insights about their building portfolios and to transition solar-ready sites into the pipeline for project development. In addition, DCAS reviewed agencies' five-year capital plans to identify existing buildings that are scheduled to have roof replacements or major renovations, as well as to identify new construction opportunities. DCAS worked especially closely with the Department of Education (DOE) and the School Construction Authority (SCA) to refine the assessment of the City's public-school portfolio, which accounts for 48% of all buildings evaluated in this report. Furthermore, DCAS collaborated with the Department of Environmental Protection (DEP) to examine WWRFs and the potential space for solar installations over aeration tanks, settling tanks, and other open areas. Lastly, DCAS asked agencies to report their inventory of parking facilities—both ground level lots and garages—and modeled those spaces for preliminary capacity estimates.

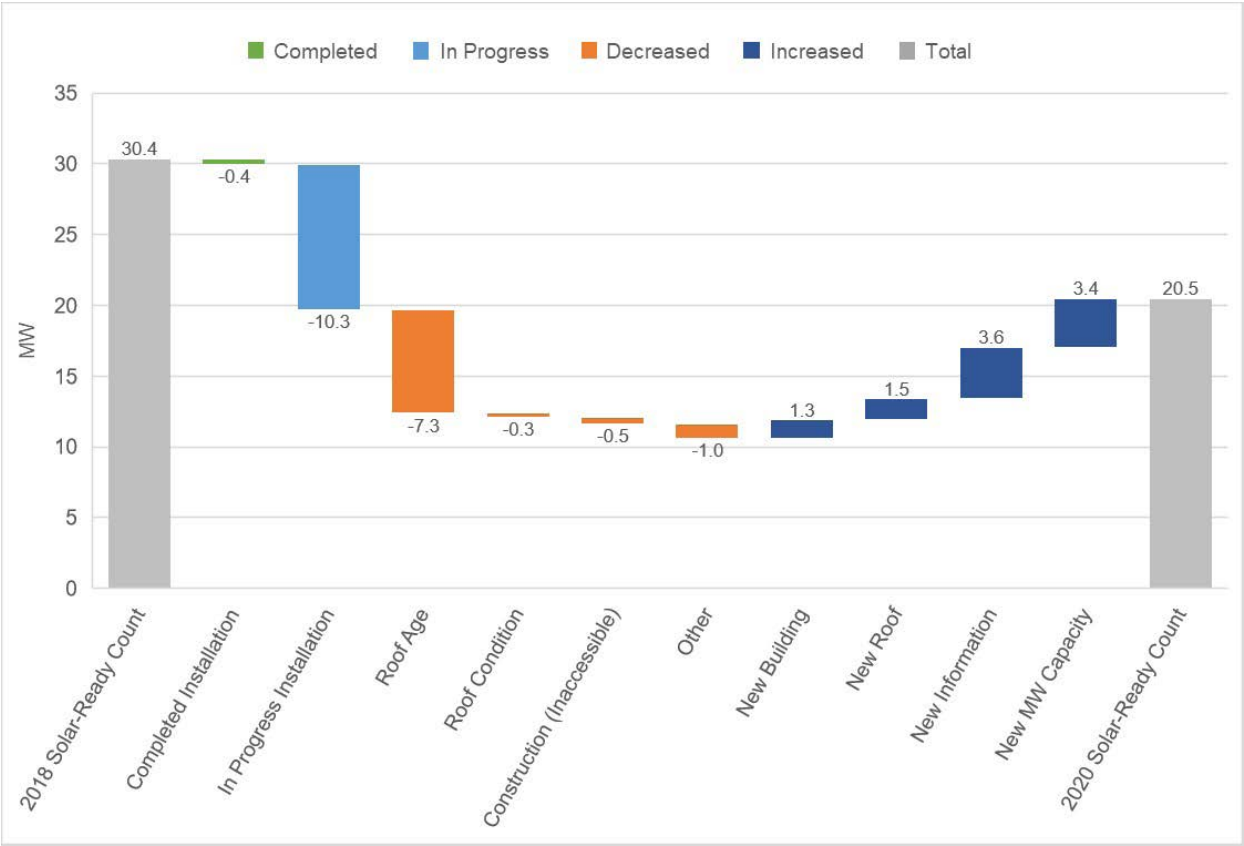

Solar-Ready Sites

DCAS evaluated 1,914 buildings that do not have an installation completed or in progress for solar-readiness.^{8,9} DCAS classified 251 of these buildings (20 MW) as solar-ready in 2020, compared to 413 solar-ready buildings (30 MW) in 2018. **Figure 3** below illustrates the key sources of change between 2018 and 2020. The largest and most promising source of change was that 66 sites, totaling 10 MW, transitioned from the 2018 Solar-Ready category to the 2020 In Progress category and three sites had solar PV installations completed after 2018, totaling 0.4 MW. Another source of change was the reduction of solar-readiness due to the aging of roofs beyond the 10-year cut-off as defined in LL24, that resulted in the removal of 74 buildings (6 MW) from solar-readiness. Furthermore, 22 sites (1 MW) were removed due to further research that revealed building construction originating from 1920 or earlier, before the advent of structural codes. Altogether, these roof age-related issues resulted in the removal of 96 buildings (7 MW) from solar-readiness. Unsuitable roof conditions caused an additional 10 buildings (0.3 MW) to be removed from solar-readiness. These reductions were partially offset by the addition of 15 buildings (2 MW) that received roof replacements and 13 newly constructed buildings (1 MW). An important distinction to make is that roof age alone is not a guarantee that a building can or should receive solar PV, as some buildings with roofs less than 10 years old may not be good candidates if the roof has existing issues.

⁸ Solar-Ready project metrics are detailed in the Appendix starting on page 35.

⁹ Solar-readiness is achieved when a facility is 10,000 sq. ft. or greater in size and has a roof 10 years or younger in good condition. Furthermore, solar-ready sites are considered to be those without solar PV previously installed or currently in progress.

Figure 3. Change in Potential Solar PV Capacity (MW) at Solar-Ready Sites—2018 vs. 2020¹⁰

¹⁰ Roof Age refers to instances where roofs aged out of the 10 years or younger threshold or where buildings were built before 1920. *Construction (Inaccessible)* refers to sites that are currently under construction within their home agency due to non-solar reasons. Ongoing construction projects render buildings inaccessible, preventing them from being considered solar-ready. Other refers to instances of missing information, unbuildable status, or issues with roof gross square footage. New Information refers to changes in past reported information or the resolution of past missing information. *New MW Capacity* refers to instances in which sites received a new helioscope model that resulted in a larger MW capacity estimate than in 2018.

In Progress Sites

In Progress installations include Solar-Ready facilities that have been vetted beyond the Solar-Readiness Assessment and have been added to a portfolio actively being developed with estimated budgets projected. As of 2020, the City has initiated design or construction of solar PV projects at 171 facilities (41 MW) across nine City agencies, with expected completion over the next two to three years.¹¹ This represents an increase of 46 sites and nearly 23 MW designated as In Progress compared to 2018. Taken together, the amount of potential solar PV capacity at In Progress and Solar-Ready sites has grown by nearly 13 MW and completed installations have grown by over 1 MW since 2018, as depicted in **Figure 4** below.

Figure 4. Solar PV Capacity (MW): In Progress and Solar-Ready Sites—2018 vs. 2020

¹¹ In Progress project metrics are detailed in the Appendix starting on page 13.

Non-Solar-Ready Sites

Of the 1,914 sites evaluated for solar-readiness in 2020, DCAS found that 1,663 sites, or 87% were not solar-ready.¹² Roof age was the largest factor leading to non-solar-readiness. Approximately 66% of evaluated sites exceeded the 10-year maximum roof age criteria for solar-readiness and 38% of evaluated sites had roofs that were over 20 years old. See **Figure 5** for the distribution of roof ages in the 2018 and 2020 assessments, which illustrates the aging of the City's rooftop portfolio. Poor roof condition was also a major factor in non-solar-readiness. Among the 1,663 non-solar-ready sites, 44% exhibited roof conditions that could not support solar installations, an increase from 37% of sites in 2018. As the number of roofs getting older or experiencing performance problems outpaced the number of new and refurbished roofs, the growth potential for solar-ready sites decreased some between 2018 and 2020. However, there may be an opportunity to reverse this trend in the coming years if solar PV installations are paired with facility improvements. Roof replacements present an opportunity to coordinate with both agency partners and City construction partners. As facilities begin planning for roof replacements—particularly if modifications to roof decking material are required and thus trigger LL92 and LL94—DCAS and agencies can stage installation of solar PV to follow roof replacements, which would result in new PV systems on roofs with the longest life expectancy and further the City's MW goals. See **Figure 6** and **Figure 7** for additional details on the causes of non-solar-readiness in 2018 and 2020.

¹² Roof Assessment Findings are detailed in the Appendix starting on page 67.

Figure 5. Roof Ages Across All Sites—2018 vs. 2020

Table 2. Summary of 2018 and 2020 Solar-Readiness Assessments

Status	2018		2020	
	# of Sites	MW	# of Sites	MW
Sites with Completed or In Progress Solar Installations				
Completed	57	10.5 MW	87	12.0 MW
In Progress	125	18.4 MW	171	41.1 MW
Subtotal	182	28.9 MW	258	53.1 MW
Sites Assessed for Solar-Readiness				
Solar-Ready	413	30.4 MW	251	20.5 MW
Non-Solar-Ready	1477	N/A	1663	N/A
Total Assessed	1890	30.4 MW	1914	20.5 MW

¹³ *Other* represents sites with an unknown building gross square footage, with green roofs, or that were unable to be located. This method of classification was used in the 2020 analysis.

Solar-Readiness by Agency

Figure 8. Distribution and Capacity (MW) of Solar-Ready Buildings by Agency

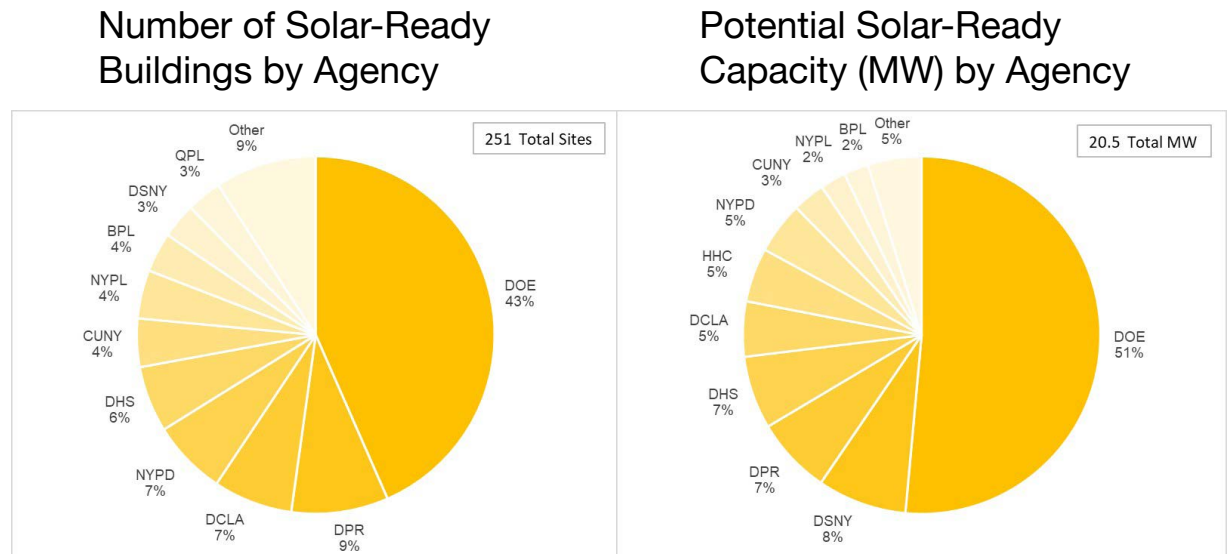

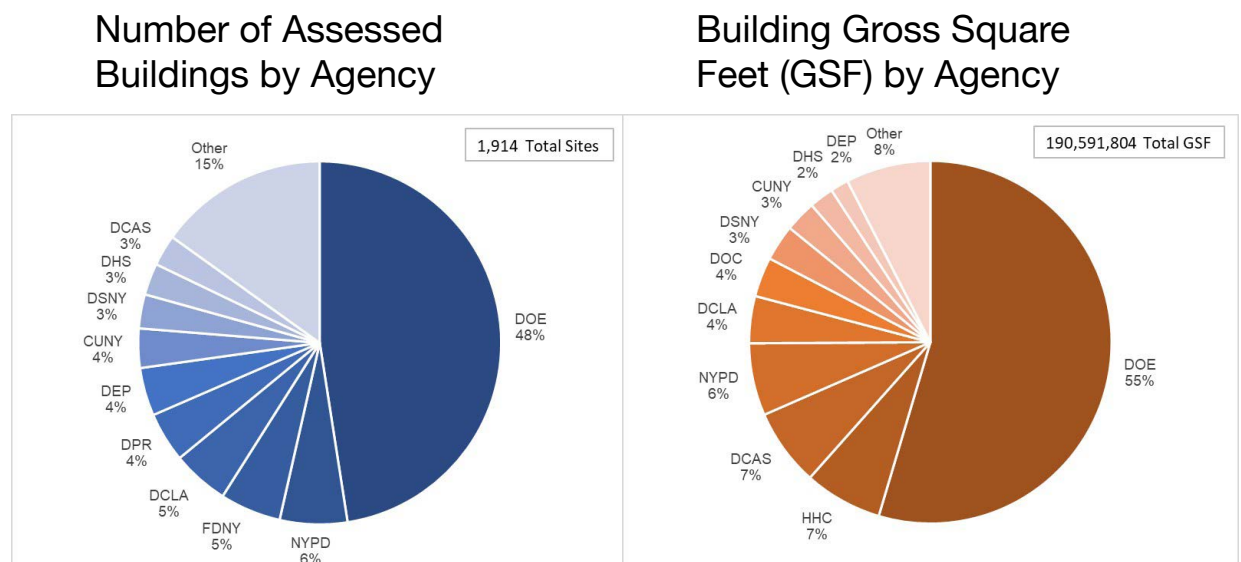

Figure 9. Distribution and Gross Square Footage (GSF) of Assessed Buildings by Agency¹⁴

¹⁴ Assessed building totals refer to buildings with rooftops and do not include completed and in progress projects.

Comparing the distribution and capacity of solar-ready buildings by agency with the distribution and gross square footage of assessed buildings by agency yields the following insights:

- **Agencies with larger buildings have a disproportionate share of potential solar capacity:**

For example, the Department of Sanitation (DSNY) operates just 3% of total solar-ready buildings, but these buildings account for 8% of total potential capacity, the second greatest amount among City agencies. DSNY facilities tend to be large warehouses with ample roof space for solar PV, and DCAS is working closely with DSNY to develop projects. On the other hand, agencies like the Department of Cultural Affairs (DCLA) and the New York City Police Department (NYPD) have a larger share of solar-ready buildings, but less of the overall potential capacity because their facilities tend to be smaller and have less available rooftop space. Developing solar at these smaller facilities will nonetheless be important to reaching the City's goals, despite the fact that the installations will likely be more expensive to develop.

- **DOE's portfolio continues to dominate, but broadening agency participation is essential:**

DOE represents by far the largest share of both solar-ready facilities and solar-ready capacity and will continue to be DCAS's biggest partner. However, as more DOE sites are developed, DCAS must advance projects with smaller agencies to reach the 100 MW goal.

- **Developing non-building solar installations is also essential:**

While **Figure 8** focuses on potential solar capacity at buildings, certain agencies offer significant opportunities to develop solar outside of buildings. DEP's WRRFs and water supply infrastructure sites will play a critical role in attaining the 100 MW goal. The Department of Parks and Recreation (DPR), with a relatively large share of both solar-ready buildings and capacity, will also become a key partner in solar PV installations. Additionally, the Department of Transportation (DOT), City University of New York (CUNY), and Health + Hospitals (HHC) have a large number of parking lots and garage structures that are excellent candidates for solar systems.

The following tables represent DCAS's accounting of completed and in progress solar PV installations (**Table 3**) and the solar-ready status of all facilities evaluated (**Table 4**). **Table 3** illustrates how large of a portion of both completed and in progress projects are within DOE facilities. This point is further highlighted by **Table 4**, which shows nearly half of solar-ready facilities belonging to DOE. Since DOE represents such a large share of facilities within the City's building stock, DCAS will continue to collaborate with DOE to deliver solar PV projects to schools.

Another key takeaway from both tables is that while few in number, smaller agencies (agencies with either few facilities or relatively fewer solar-ready facilities) also have the potential for contributing to the City's solar PV goals. DCAS has identified specific agencies that could expand the City's solar PV portfolio, including DPR, NYPD, DSNY, CUNY, the Fire Department of New York (FDNY), and the Department of Homeless Services (DHS). As the availability of ideal facilities (those with sizeable roof space in solar-ready condition) dwindles as new systems are installed, DCAS must shift focus to smaller facilities and work through some of the challenges described in this report to reach the City's 100 MW goal.

Table 3. Agency Breakdown of Sites with Completed or In Progress Solar Installations

2020 Assessment Findings

Based on the results of the 2020 Solar-Readiness Assessment, DCAS has determined the following key takeaways:

Larger-scale opportunities are concentrated at a small portion of buildings.

Of the 251 solar-ready sites identified, only 67 buildings (27%) had an estimated capacity of 100 kW or larger. Yet, solar capacities of 100 kW or greater accounted for 69% of the 20 solar-ready megawatts. In other words, the largest-scale solar opportunities are concentrated among a small number of solar-ready buildings. Considering the fixed timelines and soft-costs to develop and install a single solar installation, prioritizing the largest-scale installations will yield the greatest amount of capacity at the least cost. Equally notable is that 51% of solar-ready capacity is concentrated with DOE buildings alone. Working closely with DOE and SCA will be crucial in realizing the full solar potential of school facilities. Despite the available solar potential, as many of the larger-scale sites advance towards development, the pool of large facilities from which DCAS can draw from is dwindling.

Figure 10. Capacity Ranges (MW) of In Progress and Solar-Ready Buildings

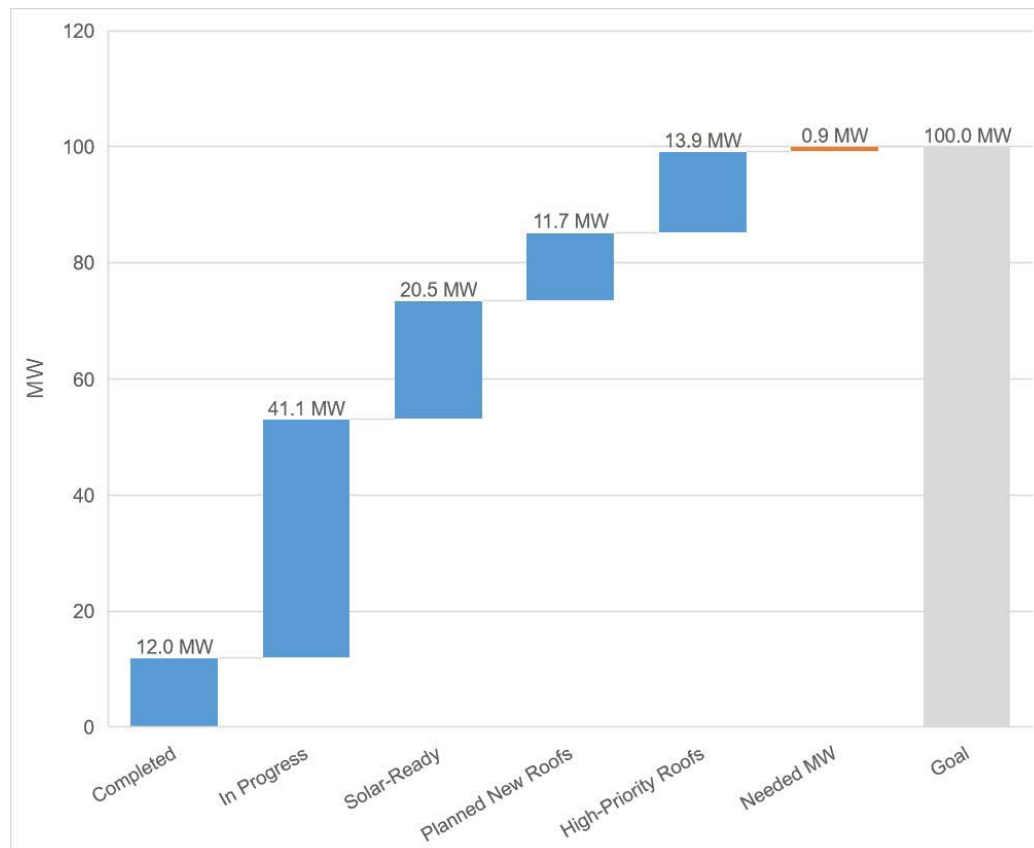

The City must proactively replace large rooftops to advance solar development.

Given the insufficient supply of solar-ready rooftops, as well as the continued aging out of significant portions of the City's rooftop portfolio, the City must proactively invest in roof replacements to unlock solar potential and pursue solar installations in tandem. DCAS has categorized approximately 80 facilities as high-priority sites for rooftop replacements. These sites alone could yield nearly 14 MW of potential solar capacity. Replacing the top ten largest rooftops and installing solar could yield nearly 4 MW of capacity.

Rooftop solar alone is insufficient to achieve 100 MW by 2025.

The City cannot reach the 100 MW by 2025 goal through rooftop solar alone. Even when accounting for planned and potential roof replacements achievable by 2025, there is a need to advance non-rooftop solar PV installations—including parking lot canopies, ground mounted systems, and installations at infrastructure sites—as well as other opportunities to achieve the 100 MW goal by 2025.

Figure 11. Total Available Rooftop Solar Capacity (MW)

Environmental Justice and Strategic Deployment of Solar PV.

In 2017, the City passed LL64, which codified Environmental Justice Areas (EJAs) for the City of New York and required City agencies to incorporate environmental justice into citywide decision-making. DCAS found that 61% of the 1,914 assessed buildings are in EJAs, with a nearly proportionate 60% of solar-ready buildings and estimated solar potential (11 MW) located in EJAs. In addition, DCAS found that 39% of completed sites (7 MW) were located in EJAs. Recognizing the need to advance environmental justice in tandem with clean energy development and GHG mitigation, 66% of in progress sites (29 MW) are located in EJAs, and DCAS will continue to prioritize developing solar installations in these areas.

Figure 12. Environmental Justice Area Distribution by Site Count

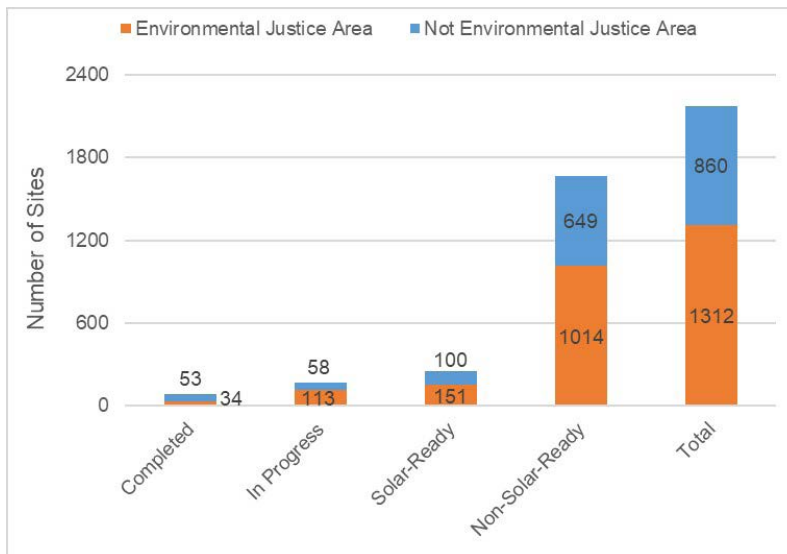

Figure 13. Environmental Justice Area Distribution by Capacity (MW)

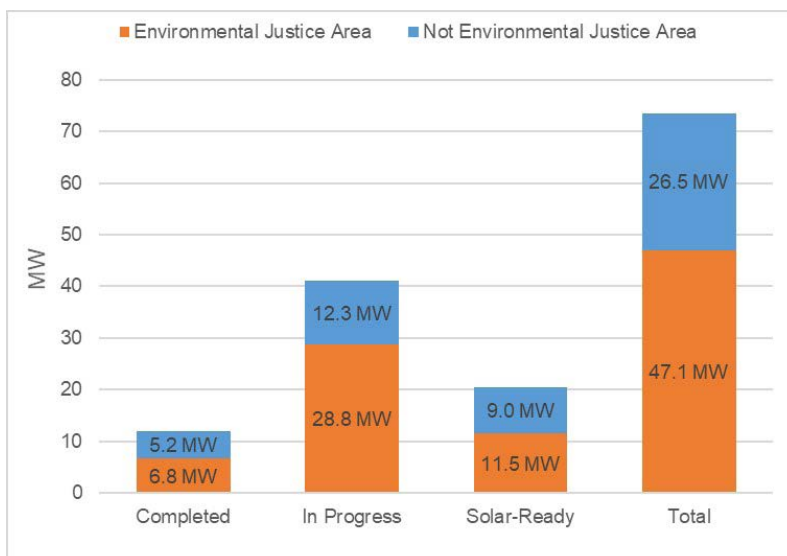

Figure 14. Solar Educational Program

Students at Global Learning Collaborative High School learn about solar systems as part of the NYC Solar Schools Education Program.

DCAS is committed to working with its partners to deliver solar education programs to students across New York City schools and building pathways for green careers. In 2015, DCAS and the DOE Office of Sustainability partnered with Solar One, an environmental non-profit with extensive educational programming, to connect the City's investments in rooftop solar on school buildings to student learning and workforce development. The NYC Solar Schools Education Program was born out of this partnership and provides free training and standards-aligned curriculum for teachers across all grade levels and subject areas. As of 2020, over 1,300 DOE educators and over 1,700 students participated in the program and received hands-on activities and free materials to integrate renewable energy and climate education in their classrooms.

Additionally, at 13 DOE Career and Technical Education (CTE) high schools, skill-building training in solar PV design and installation are integrated into electrical, engineering, and construction trades programs to help build the City's future renewable energy workforce. Nearly 1,000 CTE students have been trained to date. Expanding beyond the classroom, in the summer of 2019, four CTE students gained real-world work experience installing solar on DOE schools through paid internships with a solar installer. DCAS and its partners are committed to growing these educational programs and continuing to provide the next generation with the skills they will need to join one of the fastest growing industries in the nation.

Since 2017, DCAS in collaboration with Solar One and the Fortune Society has provided solar basics training and related vocational services to cohorts at Rikers Island. Over 100 individuals have taken a two-day in-site training course and 61 individuals have taken a five-day post release training program. Of those who had taken the Solar One training, 19 individuals have been hired, with 10 of those placements being in the construction or energy efficiency industries. The City is working with the Fortune Society, NYC Small Business Services, project developers, and individual unions to connect trainees facing barriers to traditional employment with green jobs to decrease the recidivism rate in New York City.

To supplement solar PV generation and to stabilize the local power grid, increased deployment of energy storage is a crucial part of the path toward decarbonization in New York City.

Since 2016, DCAS has implemented the following strategies to expand energy storage consideration at its facilities:

- Requiring assessments of energy storage potential as part of the planning for all solar PV projects
- Including energy storage options in solar PV solicitations wherever feasible and applicable
- Increasing collaboration with Con Edison to identify energy storage opportunities that would benefit the electric grid, while supporting the sustainability and resiliency of City facilities
- Advancing resiliency projects for solar and storage systems at facilities that do not have existing backup power systems and that meet any of the following criteria:
 - o Have unreliable grid conditions
 - o Were impacted by severe weather
 - o Act as community focal points during emergency events
 - o Host emergency responders

DCAS has also worked closely with FDNY and the Department of Buildings to adhere to the important fire, life safety, and technical requirements for energy storage and to monitor industry trends, particularly as new battery chemistries and technologies come to market, and regulatory bodies gain a deeper understanding of the safety considerations associated with the widescale deployment of these systems. This close coordination will inform DCAS's efforts to implement energy storage systems that are safe, durable, cost effective, and impactful.

Lastly, LL181 will require DCAS to perform a citywide energy storage study to review the feasibility of energy storage systems for City properties. DCAS is working closely with NREL and NYPA to develop this study. The study will review the challenges and opportunities for energy storage on public land. The coupling of energy storage with DER, like solar PV, may extend the benefits of these distributed resources, provide greater resiliency benefits, and improve local reliability. The City has been advocating for market design changes at the New York Independent System Operator and Federal Energy Regulatory Commission, like the implementation of a hybrid aggregation market participation model, that will promote the coupling of renewable DER and energy storage systems. While some progress has been made, additional regulatory changes would make this type of deployment more cost effective.

Achieving the 100 MW by 2025 goal has meant overcoming significant barriers and constraints. While unforeseen programmatic setbacks led to slower than expected growth in the program's early years, project delivery mechanism developments made since 2015, and those currently in development, have positioned DCAS at an inflection point for exponential growth. As of 2020, DCAS has installed 12 MW of solar projects and is in the process of delivering an additional 41 MW of installations. In terms of future development, DCAS has measured City buildings and other properties' solar potential and identified up to 153 MW of gross resource potential (**Figure 15**). Through research into site feasibility, agency coordination, and continued development of delivery processes, DCAS anticipates the net resource potential to be enough to meet the goal of 100 MW by 2025.

Building on lessons learned to date, DCAS's pathway to 100 MW will incorporate the following strategies:

- Accelerate High-Priority Roof Replacements:**
 Roof replacements are vital to DCAS's ability to scale up rooftop solar. DCAS has identified a number of high-priority roofs for roof replacements. Many of these facilities are at DOE schools and DCAS will work with DOE and SCA to prioritize and support these facilities for roof replacement and solar development. Additionally, DCAS has funded solar PV systems through the Department of Design and Construction (DDC) at DSNY facilities currently undergoing roof replacements, or as part of agency plans undergoing new construction. More than 80 MW of solar capacity can be installed on rooftops by 2025, accounting for completed and in progress projects as well as the additional potential of solar-ready roofs, planned new roofs, and high-priority roof replacements.
- Develop Solar Canopies at Municipal Parking Lots and Garages:**
 Long expanses of asphalt parking areas not only increase the urban heat island effect and stormwater runoff concerns, but also are underutilized assets that could be made more productive, attractive, and sustainable through the installation of solar PV canopies. DCAS estimates that 14 MW of capacity in the form of solar canopies can be developed at municipal parking lots and garages throughout the five boroughs. DCAS is currently advancing a Request for Proposal for its first parking canopy system and is exploring feasibility for other future sites.

- **Develop Megawatt-Scale Solar at City-Managed Infrastructure Sites:**

Similar to parking lots, there is an opportunity to complement rooftop solar utilizing the City's owned and operated infrastructure for megawatt-scale solar installations. WRRFs and other infrastructure sites that have available space and can either fully utilize solar power generated on site, or interconnect and export power to the electric distribution grid, are candidates for development. WRRFs present an opportunity to develop up to 15 MW of solar PV capacity. The City is currently partnering with NYPA and DEP to develop over 7 MW of solar capacity at the Ward's Island WRRF, which will include rooftop and ground-mounted installations, as well as systems on water treatment tanks and processing infrastructure.

Figure 15. Completed, In Progress, and Potential Solar Capacity (MW) by Project Category

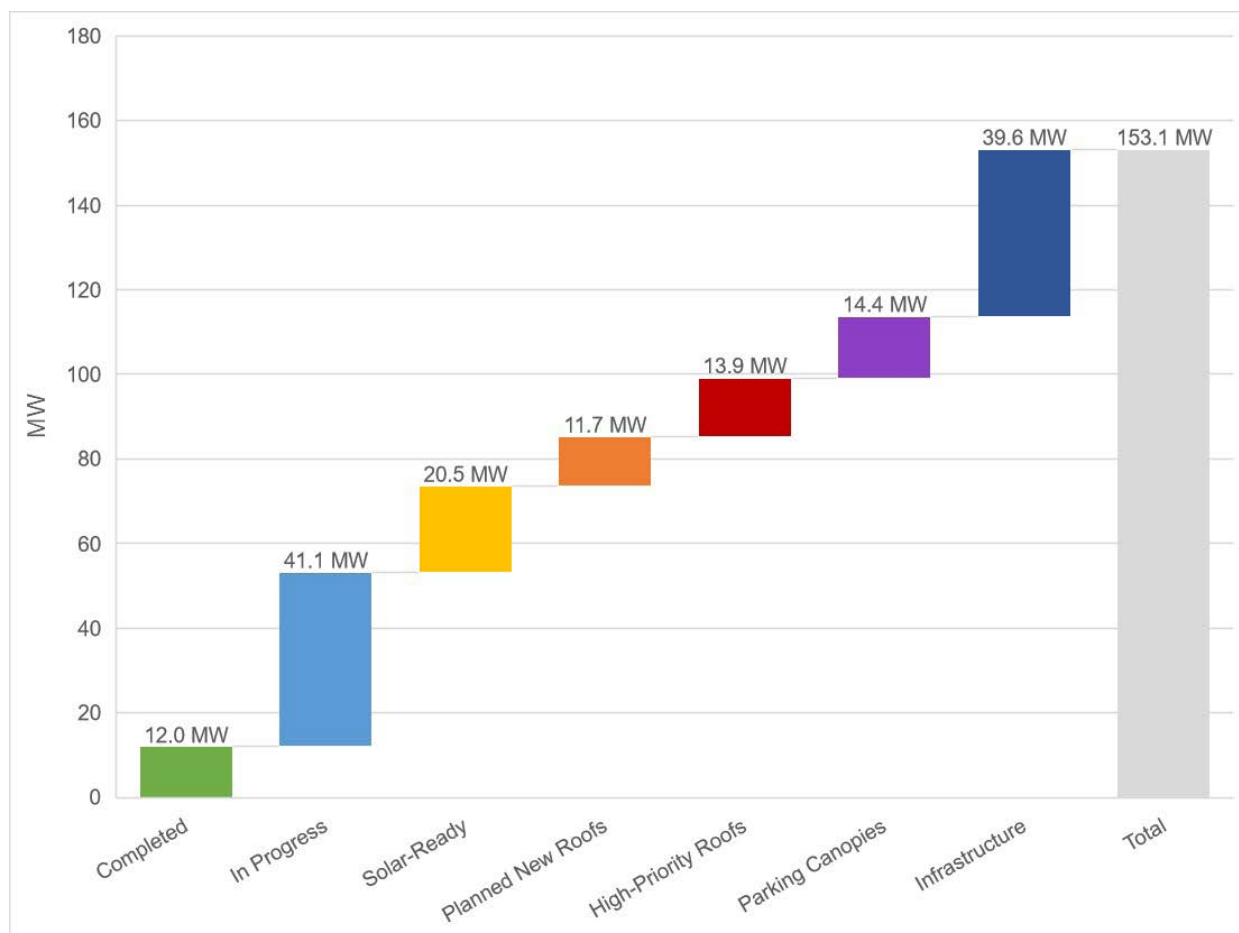

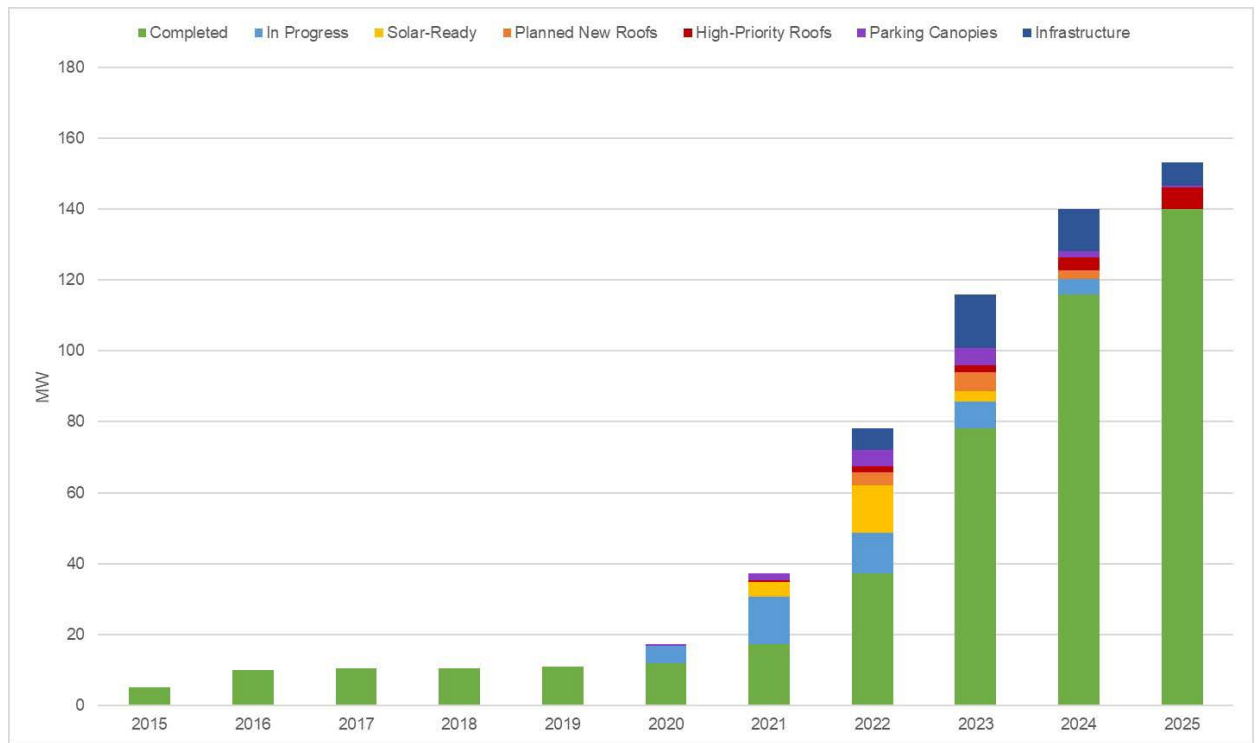

Figure 16. Historic and Projected Annual Phasing (MW) by Project Category

While establishing future solar PV projects and construction phasing is important to reaching the 100 MW goal, DCAS can further assist these efforts by improving relevant processes and resources, including:

- **Expand Contracting Channels for Design and Construction Services:**

Achieving the rate of growth needed to scale to 100 MW will require the City to utilize all available procurement and contracting channels and create new ones. DCAS developed a PQL for General Construction Services that includes solar development work and will issue solicitations in the coming months. DCAS is also working with NYPA to procure renewable energy at schools, the Wards Island Water Resource Recovery Facility, and other sites via PPAs that are able to capture the value of federal tax credits. DCAS is also exploring several other project delivery channels and partnerships to ensure that it has sufficient capacity to reach the 100 MW by 2025 goal.

- **Prioritize Environmental Justice and Community Benefits:**

DCAS will continue to prioritize environmental justice in the siting of solar systems. In addition, DCAS can bolster the resiliency of critical facilities and support equitable distribution of resources through its clean energy program. As DCAS completes its first generation of resilient solar projects, it will look for new sites and high impact opportunities to promote resiliency and environmental justice through its clean energy investments.

- **Develop the Clean Energy Workforce:**

With the pace of change in the solar industry, DCAS is committed to opening access to clean energy jobs while maintaining quality, cost competitiveness, and efficiency. DCAS will continue to partner with Local Union No. 3 IBEW of Greater New York, BCTC, the National Electrical Contractors Association, community-based workforce development organizations, and private developers to strengthen and diversify the clean energy workforce.

- **Operate and Maintain for System Longevity and Efficiency:**
To achieve the aggressive GHG reduction goals set forth in LL97, DCAS must efficiently operate and maintain its portfolio of solar energy assets. Efficient operations and maintenance will require state-of-the-art data analytics to predict system maintenance needs, a skilled workforce made up of City government personnel and contractors to conduct O&M activities, and ongoing financial resources. DCAS has partnered with NREL to develop high-quality equipment specifications, O&M best practices, and other performance standards to improve the efficiency of existing systems.

The City of New York has set forth an ambitious municipal renewable energy goal. With 12 MW of solar PV completed and 41 MW more underway. As of December 31, 2020, DCAS has laid a solid foundation for solar project delivery. Reaching 100 MW will require significant focus and effort to scale up solar project completions within the next five years.

As DCAS ramps up construction after the depths of the pandemic, it is imperative to utilize all avenues of procurement to deploy solar as quickly and efficiently as possible. DCAS is aiming to increase the annual installation goal to 20 MW starting in 2022. While these goals are technically feasible, and 41 MW are already in progress, to accomplish these objectives requires sustained commitment from all parts of city government to minimize challenges experienced to date. The DCAS team has fostered close partnerships with DOE, SCA, DDC, and other agency partners to streamline the solar rooftop design and construction process. Additionally, DCAS is pursuing both Capital and PPA procurement mechanisms to deploy multiple projects simultaneously. As DCAS completes its active projects, it will develop new project bid portfolios from the solar-ready roof list. Furthermore, with the recent NYPA PPA project award, DCAS is beginning to design non-rooftop solar options including solar canopies at Ward's Island. While designing the Ward's Island installation, DCAS will apply this technical experience to begin new non-rooftop projects with DEP, DOT, and other agency partners. Efficient project deployment, multiple contracting mechanisms, and creative solar designs will scale up the City's installed solar capacity.

Installing 100 MW of solar PV by 2025 is an aggressive goal, and one whose importance is underscored by the current COVID-19 pandemic. This public health crisis illustrates how global and local challenges, including climate change and its associated morbidities, can have devastating impacts if not addressed head-on. By incorporating environmental justice, workforce development, and forward-thinking policy with clean energy projects, DCAS has positioned itself to achieve meaningful goals in the realm of climate change and emissions reduction. 100 MW of solar will provide new renewable energy resources, while mitigating the effects of climate change and providing a more sustainable environment for all New York City residents.
