Notes on Z-score

A Z-score is a numerical measurement of a value's relationship to the average of a group of values. It is a useful metric for making comparisons between distributions or variables.

Z-scores reveal the number of standard deviations the score is either above or below the average.

Z-scores may be positive or negative, with a positive value indicating the score is above the average and a negative score indicating it is below the average. If a Z-score is zero, the value is identical to the average.

The Z-score is obtained by subtracting the sample average from an individual value and then dividing the difference by the sample standard deviation.

For the purpose of this report, Z-scores were calculated for crime type and then averaged for each Precinct. This Z-score average was then sorted for ranking purposes and the highest thirty-five (35) were selected for additional analysis and mapping.
