Over the past two decades, New York City has seen tremendous growth in cycling, reflecting broad efforts to expand the city's bicycle infrastructure. In the mid-1990s, the New York City Department of Transportation (DOT) established a bicycle program to oversee development of the city's fledgling bike network. Since then, DOT has led the charge to build an expansive network that serves an ever growing number of New Yorkers. These efforts were accelerated following the release of PlaNYC in 2007, which set ambitious goals toward creating a more sustainable city. In 2019, following an increase in cyclist fatalities, the City developed the Green Wave Plan, which committed substantial resources to further expand cycling infrastructure throughout the five boroughs.

As part of the Green Wave, DOT installed 21.4 lane-miles of protected bike lanes in 2019. DOT also installed 22.8 lane miles of dedicated cycling space in Priority Bicycle Districts—neighborhoods with comparatively high numbers of cyclist fatalities and severe injuries and few dedicated cycling facilities. DOT has plans to install at least 30 miles of protected bicycle lanes citywide, however, that implementation is likely to be affected by the COVID-19 PAUSE.

With this expansion of bicycle routes on City streets, along with the miles of new greenway paths in public parks, and the expansion of bike share, there have never been more people biking in New York City. The creation of local bike networks beyond the Manhattan Core—in communities such as Elmhurst and Flushing—encourages people to use a bicycle to get around their own neighborhoods, run errands, or visit friends. Completion of critical links in the protected bike lane network in places like the St George Ferry Terminal and East New York makes riding a bike more accessible. Miles of protected on-street bike lanes are emboldening the more cautious and risk-averse New Yorkers to take to the streets on a bike.

This Cycling in the City brief, which will be updated annually, seeks to answer two basic questions:

- How frequently are New Yorkers using cycling as a mode of transportation?
- How is that frequency changing over time?

Methods

Understanding who is biking in New York City and how often they ride is incredibly valuable, but cycling demographics and trends are very challenging to evaluate. Historically, evaluation of cyclist activity in New York City was centered on counting the number of bicycles entering and exiting the core. However, cycling has grown and matured dramatically as a mode of transportation since the first counts were conducted in 1980. New Yorkers are using bikes for a much wider variety of trips, making it even more difficult to assess bicycle use in the City.

In an effort to better understand the widening breadth of cycling, DOT partnered with the New York City Department of Health and Mental Hygiene (DOHMH) to include a question about cycling in DOHMH's annual Community Health Survey. This, question, along with other questions relating to cycling frequency, cyclist comfort, and reasons for riding a bicycle, are included in DOT's annual Citywide Mobility Survey as of 2017.

By focusing on the cyclist and not the trip, these surveys provide a more holistic approach to quantifying cycling activity, especially when used in combination with national surveys, ongoing bike counts, and Citi Bike trip data. Taken as a whole, this information helps paint a more accurate picture of cycling in New York City than we have ever had before.

This brief examines these data sources in order to provide a **snapshot** of cycling in the city today and an evaluation of **trends over time**, providing a better understanding of how cycling has grown over the past decades.

For details regarding the data presented in this document, please consult the Data Types, Sources, and Limitations page of the Appendix.

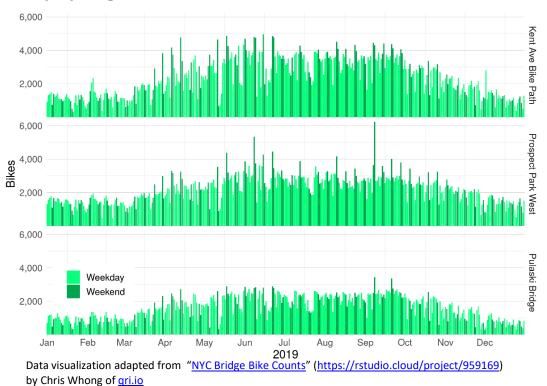

COUNTING CYCLISTS

Manual and Automated Bicycle Counts

The NYC DOT began counting cyclists on Manhattan avenues at 50th St, on the Staten Island Ferry, and on the East River Bridges in 1980. Starting in 2014, NYC DOT began counting cyclists on the East River Bridges with automated counters. Currently, there are thirteen locations with automated bicycle counters.

These data, along with Citi Bike system data, are available at NYC's Open
Data Portal.

Daily Cycling Totals – Selected Automated Counter Locations

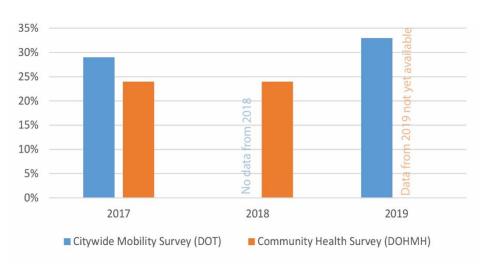

Cycling in the City A Snapshot

NUMBER OF CYCLISTS

Both the NYC DOHMH Community Health Survey and the NYC DOT Citywide Mobility Survey include a question that ask how many times the respondent rode a bike in the past 12 months. While only data up to 2018 is available for the Health survey, 2019 data is available for the Citywide Mobility Survey.

Percentage of New Yorkers who Rode a Bike at least Once

According to the 2018 Community Health Survey 24% of adult New Yorkers, rode a bike at least once, representing 1.6 million people. Of those adults, nearly eight hundred thousand (787,000) rode a bike regularly (at least several times a month)

Unique Citi Bike Subscribers who Took at least One Trip

Citi Bike trips can be categorized by unique subscribers. This chart shows the amount of subscribers—whether they have long-term memberships, or purchased a short-term pass—who made at least one trip each year. Only the subscriber's first trip is counted.

The amount of long-term subscriber trips has increased each year since 2015 and is another way to estimate the increasing number of New Yorkers who reported riding a bike at least once in the past year.

According to the 2019 Citywide Mobility Survey 33% of adult New Yorkers, rode a bike at least once, representing more than 2 million people. Of those adults, approximately nine hundred thousand (900,000) rode regularly (at least several times a month)

BICYCLE NETWORK TOTALS & TRIPS PER DAY

Cycling in the City Trends Over Time

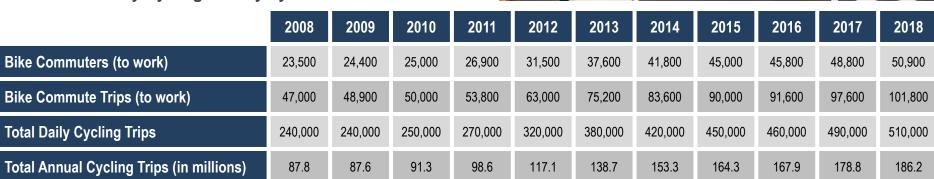

DAILY AND ANNUAL CYCLING

The Decennial Census and the American Community Survey (ACS) Journey to Work data provide long-term statistics on the number of people in New York City who use a bicycle as their primary mode of commuting to work (Daily Bike Commuters).

Commuters typically make two commute trips each day (Daily Bike Commute Trips) and research shows that commuting represents approximately one-in-five travel trips in New York City, therefore we can estimate that there are approximately four additional non-commuting bike trips for each commuting bike trip (Total Daily Cycling Trips).

Census data is available for 1980, 1990, 2000 and American Community Survey data has been collected annually since 2005. Because the sample size is smaller for the ACS, a rolling three year average is used for each year after 2000 (e.g. the 2017 number is based on the 2015, 2016, and 2017 surveys).

2013 and 2018

SEASONAL VARIATION

Respondents to the Citywide Mobility Survey were asked to document all trips they took in a week. Citi Bike trips made up approximately 13.4% of all reported bike trips. Using the total 2019 Citi Bike trips for each month and the results of the Citywide Mobility Survey, the average amount of bicycle trips per day can be estimated.

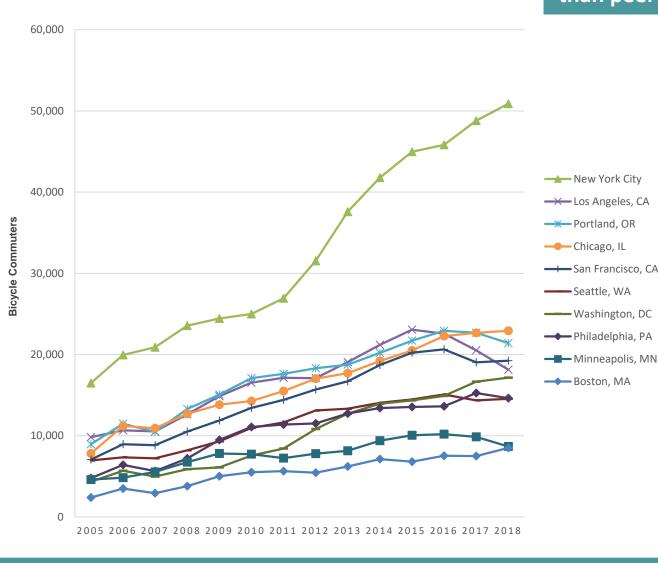

Cyclist trips vary over the course of the year due to changes in temperature and precipitation, thus the average amount of trips per day will vary greatly throughout the year. Between April and October, there are about 580,000 cycling trips made in New York City each day

COMMUTERS BY BOROUGH

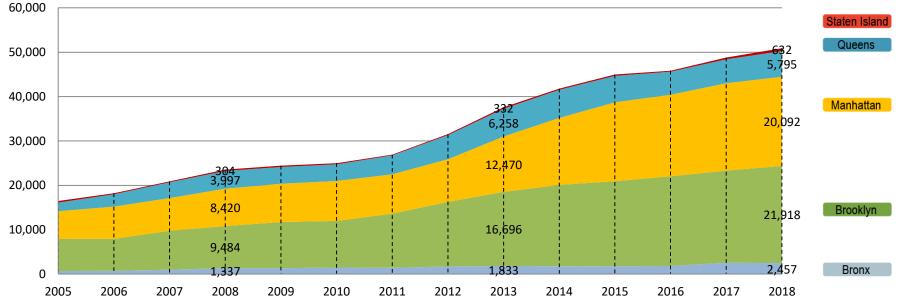

As the cycling population grows, the American Community Survey has become a more reliable source for citywide commuter cycling numbers. When it was first launched in 2005, the number of commuter cyclists was close to or completely within the margin of error for the survey, making it difficult to look at growth by borough. To supplement this data beyond commute to work trips, DOT continues to develop additional sources of survey data, such as the Citywide Mobility Survey, which will be offered for a fourth year in 2020.

In the past five years the totals for both Brooklyn and Manhattan have grown enough to stand alone, but totals for the Bronx, Queens, and Staten Island still remain close to the margin of error. Although year by year numbers may vary, the overall trend shows citywide growth.

American Community Survey data has been collected annually since 2005. Because the sample size is smaller for the ACS, a rolling three year average is used for each year after 2000 (e.g. the 2018 number is based on the 2016, 2017, and 2018 surveys).

Commute to Work – Rolling 3 Year Average from ACS by Borough

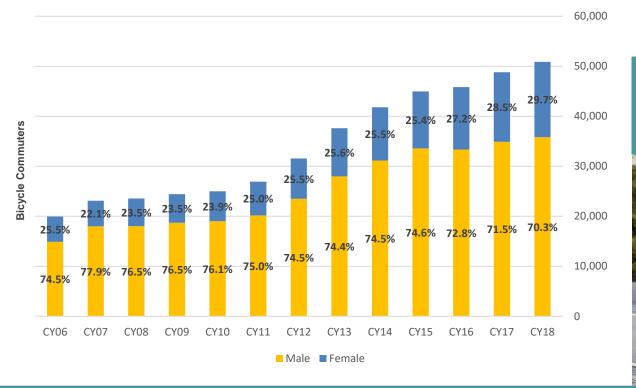

CYCLING BY MALE AND FEMALE

Understanding the gap between male and female cyclists is important to the growth and improvement of the bicycle network as a whole. Sources that track cycling by sex include Journey to Work, Citi Bike, and regular bike counts.

The gap in New York City closely mirrors the national trend of one female cyclist for every three male cyclists (FHA, 2009). While there is still much to improve upon, the overall cycling population is growing and both the ACS and Citi Bike trip numbers show that growth among female cyclists is outpacing growth among male cyclists.

American Community Survey data has been collected annually since 2005. Because the sample size is smaller for the ACS, a rolling three year average is used for each year after 2000 (e.g. the 2018 number is based on the 2016, 2017, and 2018 surveys). Note: The Census Bureau specifically words questions to capture a person's biological sex and not their gender.

CITI BIKE

In 2013, New York City launched the first phase of Citi Bike—the largest bike share system in North America. A five-year expansion began in 2019 that will ultimately double the size of the system. New York City also launched a dockless bike share pilot program in July 2018 that contributed an additional 300,000+ cycling trips from July 2018 – December 2019 (not included in data below).

Bike share makes it more convenient for New Yorkers—even those who don't own a bicycle—to make short trips by bike and provides an important supplement to the existing transportation network, facilitating multi-modal trips.

Trips per day is averaged from January through December.

MIDTOWN—CROSSING 50th STREET

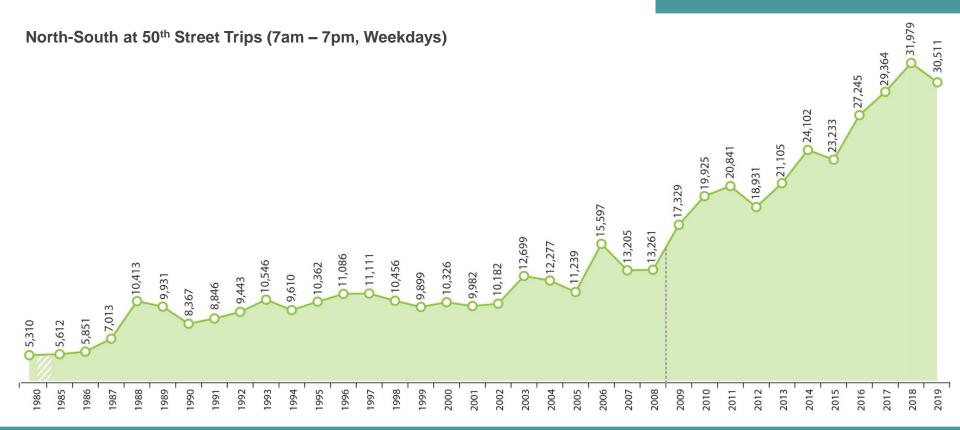

NYC DOT also counts cyclists entering and leaving the core at 50th Street along the avenues and Hudson River Greenway. This data was first recorded in 1980, and has been collected annually since 1985, and three times per year—typically in May, July, and September—since 2007.

Midtown is the heart of the city where jobs and other activities are heavily concentrated, this density is both an opportunity and a challenge for growing cycling. Through Citi Bike and the enhancement of the bicycle network, cycling in midtown has seen solid growth with the potential for more.

Note: Individual totals for each street are available in the appendix of document.

Cycling on the East River bridges

15,634

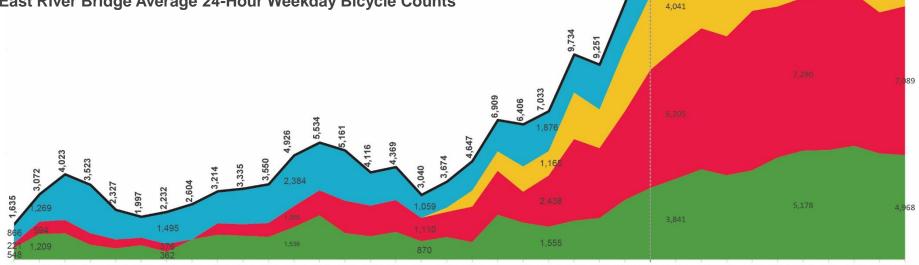

EAST RIVER BRIDGES

Many New York City cyclists use the Queensboro, Williamsburg, Manhattan and Brooklyn bridges to connect between the boroughs and the Manhattan core. Comparing counts on these bridges from year to year is useful to show trends in cycling use over time. The growth of Citi Bike and the launch of NYC Ferry Service on the East River, however, has changed the role of these bridges as an indicator of overall cycling activity, but they remain important to understanding how cycling has evolved in recent years.

From 1980-2013, NYC DOT conducted periodic manual East River bridge bike counts. In 2014, NYC DOT installed automated counters, which provide continuous 24 hour data every day of the year that is averaged on a monthly basis.

Note: From 1980 to 2013, a multiplier of between 1.25 and 1.59 was applied to 12-hour 7am-7pm bicycle counts. This multiplier was developed from three years of automated count data collected since January 2014 and provides an estimated 24 hour count. Individual totals for each bridge are available in the appendix of document.

Cycling in the City Appendix

DATA TYPES, SOURCES AND LIMITATIONS

The ideal source of cycling data is robust, comprehensive, and goes far back in time. In reality, information about cycling in New York City is very difficult to collect due to the geographically dispersed nature of cycling activity, the wide variety of trip types, and variations in ridership affected by weather. This brief evaluates data from a variety of sources, each with its own strengths and limitations.

Bike Counts are conducted at specific locations either by human observers or automated machines. Typically, manual counts are conducted from 7am-7pm on a non-holiday weekday with no precipitation. The counting season lasts from April to October. The strengths of this approach are that these numbers represent actual bike trips, and that in New York City, regular counts have been conducted at some locations since as far back as 1980, including the four East River bridges that connect Queens and Brooklyn to the Manhattan core and at 50th Street in Midtown. The limitations are that the geographic data points are limited; and that they emphasize longer distance, inter-borough trips that are often taken by commuters. From 1980-2006, NYC DOT performed manual East River bridge bike counts only once per year. Starting in 2007, three counts were conducted annually in May, July, and September. In 2008, the number of counts further increased to 10 monthly counts at each location. In 2013, NYC DOT installed automatic counters on the four East River Bridges that now collect data 24-hours per day, 365 days per year, providing much more complete data set for these particular locations.

Citi Bike Data accounts for every trip taken on a Citi Bike and therefore provides very comprehensive data about the number of trips over time, as well as detailed information about origin, destination, time, and distance traveled. However, this data set is limited to cyclists using Citi Bikes and to trips that begin and end within the Citi Bike service area, which—at this point in time—covers only a small portion of the city's streets. In addition, it is difficult to determine how many Citi Bike trips are new cycling trips rather than trips that would have been made using a personal bike anyway.

As the years pass, these data will provide a strong sense of the magnitude of change in cycling use. System expansion will allow these robust trip data to capture cycling trends in new neighborhoods each year.

Bike Use Surveys collect information about cycling from samples of the general population. These surveys do not typically provide information about where people are cycling, but they are more geographically encompassing and can more accurately gauge the number of people who are biking, including those who may not ride past typical count locations or use bike share. The following are two major sources of cycling survey data that are used in this brief, one collected at the national level, and the second collected at a citywide level.

National Surveys, including the Decennial Census and the American Community Survey (ACS) ask respondents which mode of transportation they use to get to work. Known as, "Journey to Work," this data set was collected as part of the long form of the Census from 1980 to 2000 and since 2005 is collected as part of the ACS. The strength of this data set is that it can be used to compare cities across the country but it also has several limitations. As part of the Census, the sample size was large (approximately 1 in 6 commuters), but it was only collected every ten years. As part of the ACS, the sample size is smaller (about 2.75% of households, or 240,000 each month of the year) but it is collected annually on a rolling basis. To address the smaller sample size, this report uses a three year rolling average to determine change over time.

The Journey to Work data set is also limited in that non-commuting bike trips, such as recreational or utility trips, are excluded. It also only accounts for the primary mode of commuting and therefore does not necessarily include bike trips made as part of multi-modal commutes or by occasional bike commuters. Seasonal variations in commuting patterns can also affect the data; respondents may answer the question differently depending on the time of year they are asked.

Citywide Surveys such as the NYC DOHMH Community Health Survey and the NYC DOT Mobility Survey ask respondents specific questions about their bicycle use, providing information about cyclists who may only bike to work occasionally or who regularly bike but not for commuting purposes. The sample size for these surveys is smaller than the national surveys (between 1,000 and 10,000 people depending on the survey).

ESTIMATE OF DAILY CYCLING

The Daily Cycling Trip estimate begins with the Journey to Work data from the American Community Survey. It provides estimates of how many people use a bicycle for daily commuting trips to work. According to an average of the last three years of Journey to Work data (2016-18), there are approximately 50,900 bicycle commuters in New York City who take 101,800 trips daily (assuming that each commuter takes two trips). The New York State 2009 NHTS Comparison Report (Oak Ridge National Laboratory, 2012) indicates that 18.2% of trips that New Yorkers take using personal vehicles are commuting trips to work. This would indicate that potentially 559,000 (101,800/18.2%) total bicycle trips are taken each day. For the purposes of this report, a more conservative assumption that bike commute trips are 20% of total bike trips is used, resulting in an estimate of 510,000 daily cycling trips in 2018.

The NYC DOT Citywide Mobility Survey provides an opportunity to validate these assumptions. The survey includes a trip diary, where respondents list every trip they took in the last seven days. According to the survey results, which distinguish Citi Bike trips from other bike trips, 13.4% of the respondent's bike trips were taken using Citi Bike. Multiplying the monthly total amount of Citi Bike trips by 13.4% and then adding that amount to the monthly Citi Bike trips yields an approximate amount of total bike trips for each month. Similarly, multiplying the total amount of Citi Bike trips in a year by 13.4%, adding the total yearly Citi Bike trips, then dividing the result by 365 days yields an average daily amount of approximately 470,000.cycling trips.

Although, the methodology used for each of these estimates is quite different, they both arrive at a relatively similar total number of trips. Therefore, it is appropriate to apply the one-in-five commute cycling trips to total cycling trips ratio assumption in order to establish estimates dating back to 1980. In addition, the growth of the Daily Cycling Trip estimate generally follows a pattern similar to the Midtown and East River Bridge bike counts.
