Pesticide Use by New York City Agencies in 2017

EXECUTIVE SUMMARY

Local Law 54 of 2007 requires the New York City Department of Health and Mental Hygiene (DOHMH) to summarize pesticide use by City agencies annually. New York City agencies account for a small fraction of pesticides used in New York City. New York State receives pesticide use data from all commercial applicators. Comparing New York City agencies' use in 2013 (the last year for which New York State data has been processed), local government use accounts for an estimated 3% of the total volume of liquid pesticides, and 18% of the total pounds of solid pesticides applied within the five boroughs of New York City. In 2017, 36 municipal agencies reported their pesticide use to DOHMH. This report summarizes pesticides applied by or on behalf of agencies on city-owned or -leased property.

Key findings include:

- Pesticides were applied a total of 304,032 times by New York City agencies in 2017. Agencies used a total of 7,209 gallons of liquid and 142,735 pounds of solid pesticide products (Table 1).
- As in previous years, roaches were the most commonly targeted pests in 2017, with rats, mice, bed bugs and mosquitos making up the top 5 targets (by total number of applications in descending order) (Table 3).
- Most liquid pesticide products (42% by volume) used by City Agencies were fungicides, while most solid products (44% by weight) were insecticides (Table 1). Excluding DOHMH mosquito larvicing that was conducted to prevent spread of West Nile Virus and other mosquito-borne diseases, most solid pesticides products (58% by weight) were rodenticides.
- Insecticides
 - Insecticides were the most frequently applied type of pesticide, accounting for 71% of all applications (Table 1).
 - The volume of all liquid insecticides increased 31% in 2017, compared with 2016 (Figure 2). This increase was due to a change to liquid formulation for certain ant gel baits (Figure 6, Appendix 1), as well as an increased use of pyrethroids.
 - Liquid pyrethroid products targeting cockroaches increased 24% from 2016 to 2017, a smaller increase than 2016. In contrast, treatments targeting bedbugs decreased slightly (Figure 6).
 - The use of solid mosquito larvicide by weight dropped by 41% compared with 2016. This decrease was due to substantial rollback of preventive treatments by the DOHMH Vector Control Program to target container-breeding mosquito species that may carry the Zika virus. Based on extensive mosquito surveillance in 2016 and 2017, the Health Department does not expect local Zika transmission.

- Herbicides
 - Liquid herbicide product use continued to decline in 2017 (Figure 2). Volume declined 13%, mostly due to reduced use of glyphosate products (Figure 3).
 - The use of solid herbicide products in 2017 was similar to 2016, due to continued use of outdoor granular turf formulations, mainly on golf courses and large institutional lawns.
 - The Parks Department no longer applies pre-emergent herbicides near roadways and along walkways and perimeters of city parks.
- “Best Management Practices” (BMP)
 - BMP products (Appendix 3) include gel and bait insecticides with little potential for human exposure. They accounted for 33% of insecticide applications in 2017. BMP applications to treat cockroaches more than doubled, compared with 2016 (Figure 4).
- Rodenticides
 - Use of solid rodenticide products increased 33% by weight, compared with 2016. This increase is partly due to a 12% rise in applications by DOHMH associated with expansion of neighborhood rat ‘indexing’ and control (Figure 1).

Pesticide Use by New York City Agencies in 2017

I. BACKGROUND

When Local Law 37 was enacted on May 9, 2005, New York City became the largest municipality in the nation to regulate the use of pesticides on city-owned and -leased property. Local Law 37 established new requirements for pesticide use on property owned or leased by the City, including the prohibition of certain products, posting of warning notices prior to pesticide use, and the requirement that agencies report their pesticide use on annual basis. With the enactment of Local Law 37, prohibitions from use were phased in for certain pesticides used by agencies or their contractors on City-owned and -leased properties. By November 2005, EPA Toxicity Category 1 (signal word “danger”) was prohibited. By May 2006, use of pesticides classified by the EPA as of July 19, 2004 as possible, probable or known human carcinogens was prohibited. Finally, by November 2006, use of pesticides classified by the State of California’s Office of Environmental Health Hazard Assessment as of March 4, 2005 as developmental toxicants was prohibited.

Local Law 37 exempted from prohibition several uses and products that posed little or no risk of human exposure, including rodenticides placed in tamper-proof containers or applied directly into rat burrows or inaccessible areas, containerized insect baits, and certain other types of insecticides such as boric acid, silica, and diatomaceous earth. The New York City Department of Health and Mental Hygiene (DOHMH), under Local Law 37 authorization, further waived from prohibition the use of all insecticide gels containing the ingredients fipronil and hydramethylnon due to their effectiveness and low potential for human exposure. In addition, Local Law 37 empowered DOHMH to consider and grant requests for waivers from prohibition on a case-by-case basis. DOHMH maintains a webpage on Local Law 37 at <http://nyc.gov/health/ll37> that includes a list of all waivers granted to agencies.

In October 2007, New York City enacted Local Law 54, which requires City agencies to report their pesticide use to DOHMH, and DOHMH to issue a summary report to the City Council and the Mayor. This is the tenth annual summary report and fulfills these requirements. City agencies have made significant improvements since the enactment of Local Law 37 to the quality and delivery of pesticide use data. In 2006, only three agencies provided data in an electronic format that enabled summarization. In 2017, thirty-six agencies reported electronic data.

II. SOURCES OF PESTICIDE USE DATA

New York City agencies are required to report to DOHMH their pesticide use by February 1 for the preceding calendar year. This report summarizes data received by the DOHMH for pesticides applied during calendar year 2017.

Source data for each pesticide application includes the product name, Environmental Protection Agency (EPA) registration number, the quantity used (expressed as either weight or volume), the method of application, the target pest, and the date and location the product was

applied. DOHMH utilizes the EPA's pesticide information system to link these data - by registration number - to determine a product's pesticide type and class, toxicity score, and its active ingredients. In addition, DOHMH links these data to the EPA Office of Pesticide Programs' List of Chemicals Evaluated for Carcinogenic Potential and the State of California's List of Chemicals Known to the State to Cause Cancer or Reproductive Toxicity, both available for download at <http://nyc.gov/health/l137>.

III. METHODS AND LIMITATIONS

Data in a variety of electronic formats were imported into a single database, where they were checked for quality, accuracy and validity. Weight and volumetric units were standardized to pounds and gallons, respectively. Products sold in solid form will primarily be reported by weight and liquids primarily by volume. Each record of data was assigned an agency identifier corresponding to the source agency. Prior to analysis, DOHMH removed all apparent duplicate records from the dataset. Data were analyzed using SQL, Excel and Access. We analyzed data by pesticide type and chemical class, and report total numbers, pounds and gallons of applications for New York City, and by agency on whose behalf the pesticides were applied.

All reporting New York City agencies and their contractors provided data to DOHMH in electronic format. DOHMH launched and hosts an electronic reporting tool, the New York City Pesticide Use Reporting System (NYCPURS) that all agencies, contractors and licensed pest control applicators can register to use and allows for the importation of data maintained by other electronic systems.

Where DOHMH was able to evaluate the completeness of these records, it is reported by agency, below. It is still not possible to fully determine whether each agency was able to report each pesticide application. Many agencies depend upon contractors to maintain records of pesticides applied and may not be certain that all contractors have fully complied with Local Law 37 reporting requirements. There are some limitations in the data:

- Staff and contractor turnover has led to difficulty maintaining dependable and timely reporting from some agencies.
- Year-to-year variations in agency pesticide use can be due to a number of factors, including but not limited to changes in practice, budgets and the incidence in actual pest problems.

Despite the above mentioned limitations, the data being captured continue to improve over previous years as more agencies and their contractors are using NYCPURS:

- Reporting errors, especially in reporting the incorrect units, were further reduced in 2017 due to continued increased use of the NYCPURS system with input standardization and consistent formatting.

In 2017, 97% of records were either imported or directly entered into the NYCPURS system. We expect to see further improvements in the data over the next year as more agencies fully adopt electronic recordkeeping, migrating existing electronic or paper systems to the NYCPURS system developed by DOHMH for electronic recordkeeping. Additional information about NYCPURS is available at <http://nyc.gov/health/l137>.

IV. PESTICIDE USE FINDINGS

A. TYPES OF PESTICIDES USED BY AGENCIES

Four main types of pesticides were applied by agencies: rodenticides (products used to kill rodents); insecticides (to kill insects); herbicides (to kill plants); and fungicides (to kill molds and other fungi).

Rodenticides

Most rodenticides act as anticoagulants and all are acutely toxic if ingested in sufficient dosages. Common rodenticide active ingredients are bromadiolone, diphacinone, brodifacuum, zinc phosphide and warfarin. Some common rodenticide products used by agencies in 2017 were: Contrac All-Weather Blox®, Contrac Rodenticide®, Weatherbloc Bait with Bitrex® and Difethialone Paste Place Packs®.

In 2017, a total of 52,146 pounds of rodenticides were applied by City agencies, accounting for 37% by weight of all pesticides applied, and 58% by weight when excluding mosquito larvicides (Table 1).

Insecticides

A total of 2,978 gallons and 62,734 pounds of insecticides were applied by New York City in 2017, accounting for 41% by volume, and 44% by weight of the total applications. Biological insecticides applied to target mosquito larvae account for 83% of insecticides by weight (Table 1). When those products are excluded, 10,485 pounds of insecticides by weight were applied, making up 12% of solid pesticides applied. Insecticides used by NYC agencies in 2017 fell largely into three classes of products: conventional pyrethrins and pyrethroids, organophosphates and carbamates, and “Best Management Practices” products, which either use active ingredients with very low toxicity or involve formulation or application methods that minimize potential exposure and environmental spread.

Pyrethrins, Pyrethroids, and Synergists

Pyrethrins and pyrethroids are less acutely toxic than the organophosphate and carbamate pesticides they have largely replaced. Accidental poisonings from professional applications are very rare, though personal use of aerosol and fogging product formulations have been associated with acute exposures, poisonings and fires. Some pyrethroids may be respiratory allergens for sensitized people, including asthmatics. Though these chemicals have lower acute toxicity, there is some emerging concern over the chronic neurotoxicity of pyrethrins, pyrethroids, and their synergists. EPA has classified pyrethrins, their synergists, and several pyrethroids as suspected human carcinogens. Pyrethrins and pyrethroids break down relatively quickly when used outdoors, but persist longer when applied indoors.

Common pyrethroid active ingredients are cypermethrin, cyfluthrin, cyhalothrin, esfenvalerate, and deltamethrin. Pyrethrin and pyrethroid products used by agencies in 2017

include Whitmere Optem ME PT 600®, Steri-Fab®, Demand CS Insecticide®, Temprid SC Insecticide®, Suspend SC Insecticide® and Tempo SC Insecticide ®.

Together, pyrethrins and pyrethroids accounted in 2017 for 55% of total liquid insecticides applied by volume and 7% of solid insecticides by weight – 44% by weight when excluding mosquito larvicides. These products made up 64% of the total number of insecticide applications. There was a 14% increase in pyrethroids applied by volume in 2017, primarily due to increased applications by NYCHA targeting roaches.

Organophosphates and Carbamates

Organophosphate and carbamate insecticides both function by inhibiting the neurotransmitter cholinesterase. Until EPA banned their use for most indoor applications in 1999 and 2000, organophosphates were the most heavily used class of insecticides. EPA also allowed the registrations for several carbamates to lapse.

The main organophosphate active ingredients used in 2017 were outdoor applications of chlorpyrifos, acephate, and trichlorfon on certain golf courses, which are exempt from use prohibitions. The only carbamate active ingredient applied in 2017 was methomyl used in containerized baits. Organophosphate and carbamate products applied by agencies in 2017 include Orthene PCO Formula II®, Chlorpyrifos 4E AG®, Dylox 420 SL Turf and Ornamental Insecticide®, and Zoecon Flytek(TM) Fly Bait ®.

Reports submitted by agencies showed that in 2017, the use of organophosphates and carbamates accounted for only 5% of total liquid insecticides applied by agencies by volume – a small increase from 2016 levels – and <1% of total solids by weight, 2% by weight excluding mosquito larvicides. These products remain a very small percentage of the insecticides used by city agencies, making up <1% of the total number of insecticide applications.

“Best Management Practices” Insecticides

Several highly effective insecticide products with little or no potential risk for human exposure have been introduced into the market. These products include biological pesticides for mosquito control, and gels and baits for cockroach and other insect control. These products are the preferred insecticides used by agencies as part of their integrated pest management program and are referred to as “Best Management Practices” Insecticides (BMP). A complete list of these products is listed in Appendix 3.

Common active ingredients for these products include boric acid, silica gel, diatomaceous earth, the bacteria *Bacillus sphaericus* and *Bacillus thuringiensis*, hydramethylnon, fipronil, avermectin, and indoxacarb. Some of the products used by agencies for this reporting year were Maxforce Roach Bait F.05®, Redzone Bait®, Vectomax FG ®, VBC-60394 FG Biological Larvicide Fine Granule ®, MGK Roach Bait 2822 ®, and DuPont Advion Cockroach Gel Bait®.

In 2017, 33% of the total insecticides applied by volume, and 91% by weight, were insecticidal dusts, gels and baits, or biological larvicides. Excluding mosquito larvicides, the totals equal 47% of solid insecticide products by weight. These products made up 33% of the total

number of insecticide applications, a 58% increase in the number of applications compared with 2016.

Herbicides

The herbicides used by New York City agencies in 2017 were used primarily for vegetation control in parks and for the maintenance of highways and street medians. The active ingredients most commonly used in 2017 were glyphosate, dinitroanilines, chlorophenoxyacetic acids and ureas. Herbicides were a major contributor of pesticide use by agencies.

A total of 1,006 gallons and 21,132 pounds were applied in 2017, accounting for 14% of total volume and 15% of total weight –when excluding mosquito larvicing, 23% of all pesticides reported by weight. (Table 1)

Glyphosate

The most heavily used liquid herbicides were glyphosates, best known as Roundup® products. Glyphosate is a broad-spectrum, non-selective systemic herbicide that can be used throughout the growing season. In early 2015, the International Agency for Research on Cancer (IARC), a branch of the World Health Organization (WHO), changed the classification for glyphosate to a “probable human carcinogen.” However, a risk assessment by the European Food Safety Authority (EFSA) determined that glyphosate is “unlikely to pose a carcinogenic hazard to humans.”¹ Glyphosate shows little acute toxicity, but there has been growing concern that chronic exposure may increase risk of certain cancers. There is also some evidence that heavy use of the chemical in warm climates with soil high in certain toxic metals could present significant risk in developing severe kidney damage in agricultural workers. Currently no regulatory determination has been made by the federal EPA or at the NY State level that would change the prohibition status of these herbicide products under Local Law 37. However, DOHMH encourages the pursuit of alternative weed control methods that would reduce the need for these herbicides. Glyphosate use had increased as agencies phased out the use of other herbicides prohibited under Local Law 37, but began to decline in 2013. In 2017, 36% of liquid herbicide use (by volume) contained glyphosate compared to over half the herbicide applications in 2016 (Figure 3).

Dinitroaniline

Dinitroaniline-based herbicides, which are often combined with fertilizers, are used early in the growing season as pre-emergents. They are of low acute toxicity to people, but several dinitroanilines are classified by EPA as suspected human carcinogens. Dinitroaniline herbicides break down slowly. Common dinitroaniline active ingredients are pendimethalin, trifluralin, benefin, benfluralin and prodiamine. Dinitroaniline products used by agencies in 2017 included Andersons Weed & Grass Preventer With 5% Trammel Herbicide® and Alligare Prodiamine 65 WG Herbicide®. In 2013, the Parks Department chose to no longer use pendimethalin-

1. ¹ European Food Safety Authority. Conclusion on the peer review of the pesticide risk assessment of the active substance glyphosate. *Efsa J* 2015;13:4302.

containing herbicides, after they had in previous years requested a waiver to use this herbicide around cobblestones and concrete surfaces of sidewalks or walkways in areas adjacent to roadways, such as park perimeters or “Greenstreets” or in areas adjacent to roadways with limited access from the public.

Chlorophenoxyacetic/Benzoic Acids

The chlorophenoxyacetic acid herbicides are a family of related chemicals that are often combined in products. EPA classifies one member of this class of pesticides - mecoprop-p – as a suspected carcinogen. Common chlorophenoxyacetic acid active ingredients are 2,4-D, MCPP, mecoprop-p, dicamba and MCPA. Common chlorophenoxyacetic acid products used by agencies in 2017 were Riverdale Vanquish Herbicide® and Lesco Three-Way Selective Herbicide®. In 2017, the only uses of these products were applications along city highways by the DOT and a small number of applications on the city’s golf courses and botanic gardens.

Ureas

Like dinitroaniline herbicides, urea herbicides are of low acute toxicity, but some may pose certain chronic risks. Classification as a possible human carcinogen varies within the group. Diuron, a urea herbicide among the twenty most heavily used herbicides reported by commercial applicators in the private market in the City in 2013 (most recent data available), is classified by the EPA as a likely human carcinogen. Sulfonylureas are of low acute toxicity and have been so classified. All urea herbicides are highly persistent. None of the ureas used by NYC agencies in 2017 is classified by the EPA as a human carcinogen. Common Urea active ingredients are Sulfometuron methyl, metsulfuron-methyl and Halosulfuron-methyl. Common urea products used by NYC agencies in 2017 were Dupont Oust Extra Herbicide®, Dupont Viewpoint Herbicide® and Nufarm Prosedge Selective Herbicide ®. In 2017, the only uses of these products were applications along city highways by the DOT and a small number of applications on the city’s golf courses and botanic gardens.

Fungicides

Many of the commonly applied fungicides are classified by EPA as suspected carcinogens. The potential for exposure can exist throughout the growing season, because many of these fungicides are also persistent, with half-lives measured in months and years. Degradation does not necessarily reduce the hazard, because some fungicides also have highly toxic breakdown products. Fungicides were most commonly applied by NYC on golf courses, and these applications are exempt from Local Law 37 prohibitions.

The active ingredients of fungicides commonly used in NYC in 2017 were chlorothalonil, thiophanate-methyl, propiconazole, azoxystrobin, iprodione and triadimefon. Common fungicide products applied in 2017 include Daconil Action®, Heritage Fungicide®, Bayleton Flo Turf and Ornamental Fungicide ® and Lesco Twosome Fungicide®.

Fungicides represented less than 1% of the total number of pesticide applications in 2017, but they made up 42% of total volume of liquid pesticides applied, 5% of total weight of solid products, and 7% of weight, after excluding mosquito larvicides (Table 1). Though the total volume of liquid fungicides reported has only increased slightly since 2012, they are now the most

heavily used type of pesticide reported by volume. Much of this increase could be due to a shift to a liquid formulation from a solid product (Figure 1 & 2).

B. SUMMARY OF CITYWIDE PESTICIDE USE

Pesticide use can be measured and compared in a number of ways. Throughout the remainder of this report, we describe frequency of applications and quantity applied. Quantities for liquid applications are measured as volume in gallons. Quantities for solid applications are measured as weight in pounds. Pesticides were applied a total of 304,032 times by New York City agencies in 2017, 28% more than in 2016, with large increases in the number of applications targeting roaches. The pesticides applied most frequently by New York City agencies were insecticides. Insecticides were the most heavily used solid products (44% by weight), and fungicides were the most heavily used liquid (42% by volume). In 2017, 83% of the insecticides reported by weight were bacterial or insect growth regulator products designed to kill or halt the development of mosquito larvae in stagnant waters away from human contact. Excluding these products used as part of mosquito-borne disease control programs, 12% of total solid pesticides by weight were insecticides and 58% were rodenticide. The majority of rodenticide applied by the City of New York is placed directly into rat burrows and poses little risk of exposure to the public. Table 1 summarizes these findings of applications by pesticide type.

Table 1. Total Applications Reported Applied by NYC Agencies in 2017, by Pesticide Type

Pesticide Type	Volume		Weight			Times Applied	
	Gallons	% of Total	Pounds	% of Total	% w/o larvacide	Number	% of Total
Rodenticide	1.96	0.0%	52,146.02	36.5%	57.6%	84,730	Rodenticide
Insecticide	2,977.96	41.3%	62,734.44	44.0%	11.6%	215,285	Insecticide
Herbicide	1,006.09	14.0%	21,132.66	14.8%	23.4%	2,954	Herbicide
Fungicide	3,045.41	42.2%	6,721.78	4.7%	7.4%	984	Fungicide
Other	178.00	2.5%	0.26	0.0%	0.0%	79	Other
Totals	7,209.43		142,735.17			304,032	

Table 2 lists the ten most frequently used products used for each pesticide type on New York City owned or leased property in 2017. For each, we list the total volume, weight and number of applications, as well as the active ingredient(s), the EPA toxicity category, whether the product is considered a known, possible or suspect carcinogen by EPA, and whether the product is listed by the State of California as a reproductive or developmental hazard. For this and subsequent product tables, the toxicity category refers to the EPA's assigned label warning to indicate the degree of acute toxicity from oral, dermal and inhalation exposures on a scale from 1 to 4. Toxicity Category 1 indicates pesticides considered highly toxic and whose label requires the signal word, "Danger". Toxicity Category 2 products are considered moderately toxic and product labels carry the word "Warning". Toxicity Category 3 products are considered to be slightly toxic, while Toxicity 4 products are considered relatively non-toxic. Both toxicity categories 3 and 4 carry the signal word "Caution." A complete list of products used by New York City by pesticide class is included in Appendix 1.

C. CHANGES IN PESTICIDE USE

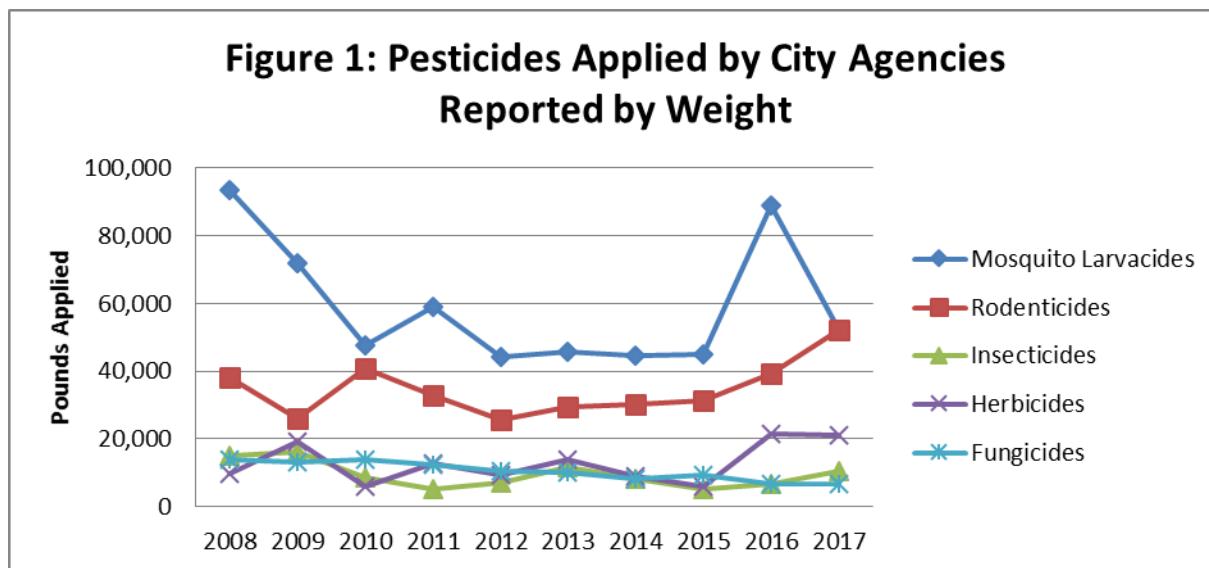

The level of completeness of city agency pesticide reporting has improved dramatically over the past ten years, making analysis of trends in pesticide use possible since 2008. A complete listing of application amounts by target pest is listed in Table 3.

Table 3: Complete listing of pesticide applications by New York City Agencies by Target Pest, 2017

Target Pest	Volume in Gallons	Weight in Pounds	Total Applications	% of Total Applications
Roaches	1,281	4,032	190,842	63%
Rats	0	43,226	55,846	18%
Mice	15	8,852	28,575	9%
Bedbugs	501	773	11,758	4%
Mosquitoes	4	56,673	4,633	2%
Weeds, vines, or grasses	1,006	21,133	2,954	1%
Flying insects	392	418	2,463	1%
Ants	381	156	2,129	1%
Other Crawling Insects	189	403	2,008	1%
Other Pests	394	348	1,837	1%

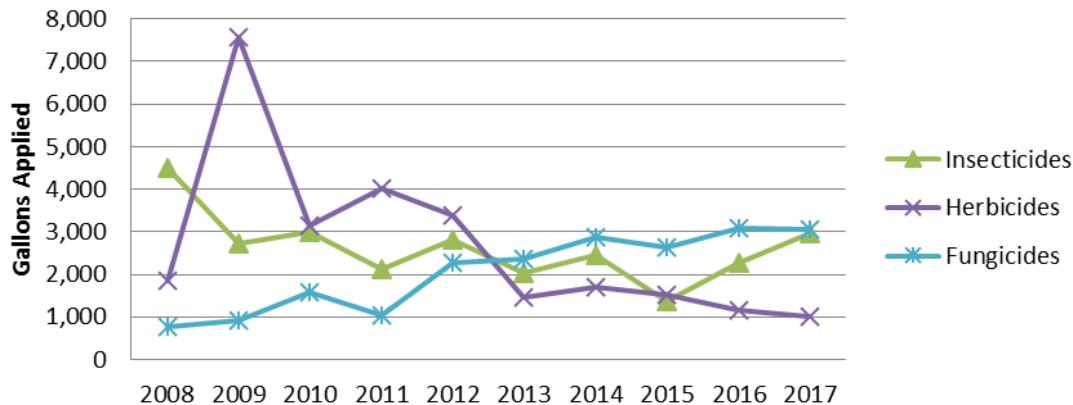

Target Pest	Volume in Gallons	Weight in Pounds	Total Applications	% of Total Applications
Fungal Disease or Infestation	3,045	6,722	984	0%
Other Rodents	0	0.4	3	0%
Totals:	7,209	142,735	304,032	

Figures 1 and 2 show trends from 2008 through 2017 in use of pesticides by city agencies by type of pesticide, with solid and liquid products reported by weight and volume, respectively. In Figure 1, DOHMH mosquito control program larvicides are charted separately from other insecticides because they represent a large proportion of city insecticide use, and because their year-to-year use varies more with weather than other insecticides. Use of solid rodenticide products showed a considerable increase (33% by weight) from 2016 to 2017, but there was an overall 13% decrease in use of all pesticides reported by weight. The decrease was mainly due to a 34% decline from levels reported in 2016 of solid insecticides, primarily due to a rollback of prophylactic treatments by DOHMH vector control to target container breeding mosquito that may carry the Zika virus. Based on extensive mosquito surveillance in 2016 and 2017, the Health Department does not expect local Zika transmission. The increased amount of solid herbicide applied in 2016 and 2017 is due to the use of outdoor granular turf formulations that include fertilizer, mainly on golf courses and large institutional lawns (Figure 1).

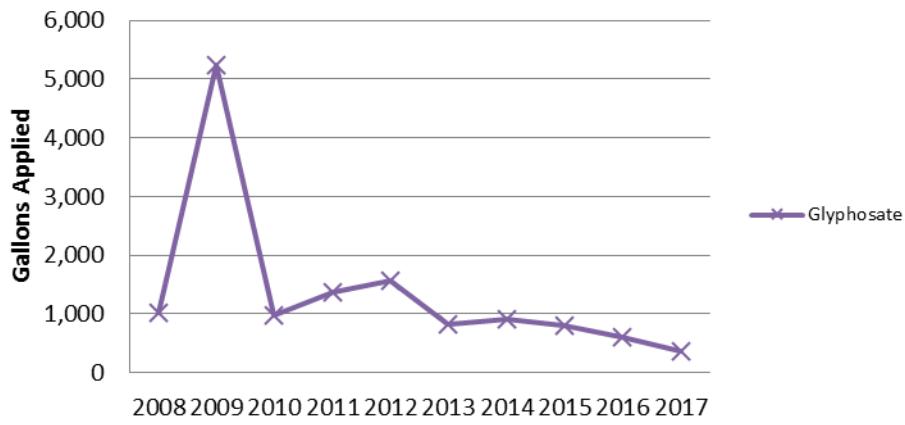

Rodenticides and mosquito larvicides are not included in Figure 2 as the products are almost exclusively solid formulations.

Figure 2: Pesticides Applied by City Agencies Reported by Volume

In 2017 overall, liquid herbicide use decreased 13% by volume (Figure 2) due to a 39% decrease in gallons of glyphosate applied (Figure 3). The high volume of herbicide (mostly glyphosate) used in 2009 was due in part to large discrete projects by the Parks Department to control invasive species in remote, often wooded, parkland.

Figure 3: Amount of Glyphosate Reported by Volume

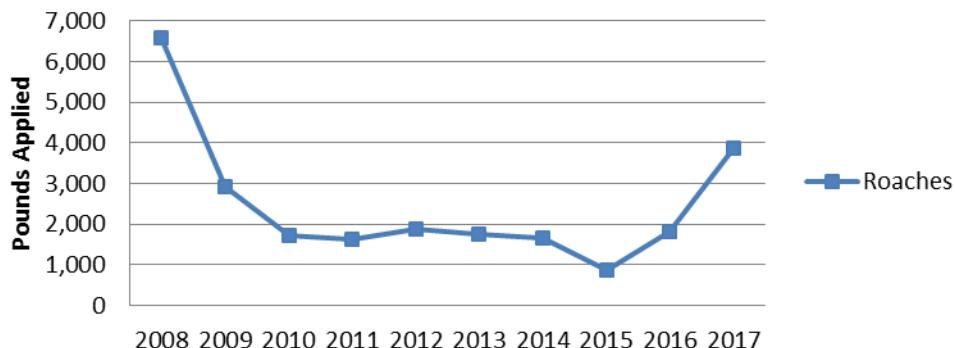

There was also a 31% increase in liquid insecticide use, reported by volume, driven by an increase at NYCHA of roach applications, further discussed below. Additionally, an ant gel bait in a liquid formulation is now commonly used (Appendix 1).

From 2008 to 2017, there was a 34% decrease in the volume of liquid insecticides used, with most of the change occurring between 2008 and 2009 (Figure 2). There had been a consistent decline in larvicide use until an increase in 2016 that declined to similar levels of previous years after the broader larvicide application plan in response to the threat of Zika virus in 2016 (Figure 1).

Use of spray formulations vs. Best Management Practices

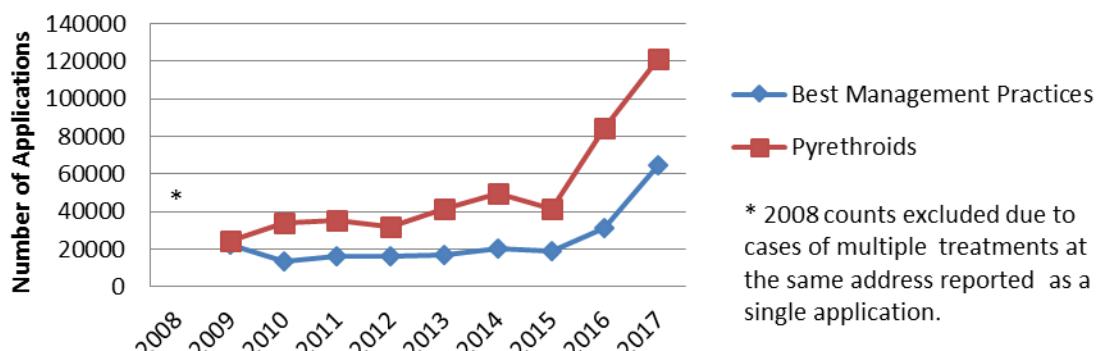

After a large reduction in BMP products to combat roaches from 2008 to 2010, the reported use of these products had leveled off. However in 2017 there were more than double the amount used in 2016 targeting roaches (Figure 4).

Figure 4: Amount of Best Management Products by Weight to Treat Roaches

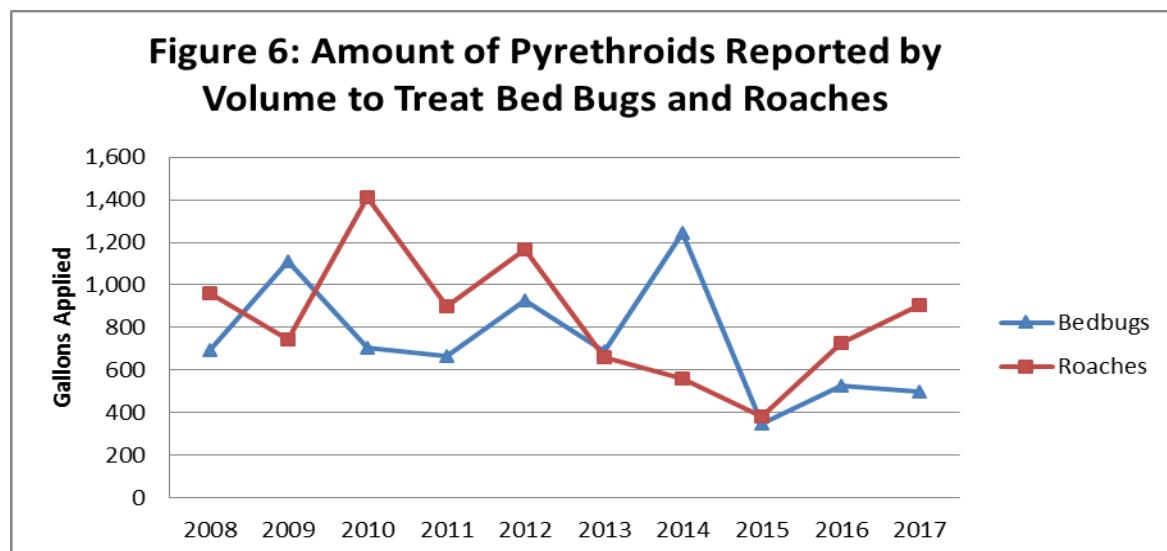

There was a 44% increase in the number of pyrethroid applications to treat roaches from 2016 to 2017, while the number of applications of BMP products also more than doubled (Figure 5). These increases in applications numbers for both pyrethroids and Best Management Products corresponded to higher application amounts by volume and weight, respectively (Figure 6 and Figure 4). In 2017, pyrethroid applications by NYCHA had a slightly smaller average amount of product used per application, compared with average amount used in 2016, suggesting a tendency to report application by individual residence rather than by building or floor of NYCHA residences. However, the overall use of both classes of insecticides was higher in 2017 than in 2016.

Figure 5: Number of Applications of Insecticide to Treat Roaches

Bed Bugs vs. Roaches

Use of pyrethroid spray products targeting roaches increased 24% by volume, and number of applications increased by 44% from 2016 to 2017 (Figure 6 and Figure 5). There was a 5% decrease from 2016 to 2017 in gallons of pyrethroids used by city agencies to treat bed bugs (Figure 6). Citywide, the number of pyrethroid applications to treat bed bugs decreased 26% in 2017, mostly due to a decrease in the number of applications for bed bugs reported by NYCHA (data not shown). The total volume of use for control of bed bugs remains low compared with previous years, while use volume for cockroaches has climbed in the past 2 years to mid-level across all years.

Rodents

Rodenticide use went up with a 33% increase in 2017 by weight (Figure 1). There was also an increase of 12% in the number of rodenticide applications. This variability year to year is due in part to the varying frequency of neighborhood rat indexing and control activity by DOHMH.

Mosquitoes

Mosquito control measures include larvicing (killing larvae) and adulticiding (killing flying adults). The DOHMH Vector Control program applied 52,249 pounds of mosquito larvicide and 3,198 pounds of adulticide in 2017. This was a 41% decline in the larvicide reported by weight in 2016 (Figure 1), due to a rollback of practices to target a mosquito species that may carry Zika virus. Based on extensive mosquito surveillance in 2016 and 2017, the Health Department does not expect local Zika transmission. Nevertheless, the agency will continue to monitor mosquito populations across the five boroughs, especially the populations which commonly carry mosquito-borne illnesses such as the West Nile virus. The amount of adulticide applied by DOHMH has varied year-to-year, depending on weather and severity of

mosquitoes. Volume of liquid adulticide use decreased 2% in 2017, compared with 2016 (data not shown).

D. SUMMARY OF AGENCIES' PESTICIDE USE

For each reporting agency, we summarize below total pesticide use by pesticide type, followed by a listing of pesticide products used by reporting City agencies.

Administration for Children's Services

The New York City Administration for Children's Services (ACS) provides for the protection of New York City's children from abuse and neglect. Along with their community partners, Children's Services provides neighborhood-based services to help ensure children grow up in safe, permanent homes with strong families. The Department of Juvenile Justice (DJJ) was merged into this agency in December 2010. The agency contracts for pest management services. Table 4 summarizes pesticide use by pesticide type. Table 5 lists all pesticide products used by ACS in 2017, primarily at facilities previously under management of the DJJ.

Table 4: Types of Pesticides Used by ACS in 2017

Pesticide Type	Volume		Weight		Times Applied	
	Gallons	% of Total	Pounds	% of Total	Number	% of Total
Rodenticide	0.0	0.0%	17.2	60.7%	75	20.2%

Aging, Department for the

The Department for the Aging (DFTA) promotes, administers and coordinates the development and provision of services for older New Yorkers to help them maintain their independence and participation in their communities. It contracts with non-profit senior service

providers to administer 76 different city-owned and city-leased sites, 33 of which engage in food preparation or storage. These facilities are privately operated and contract individually with private vendors for pest control to address typical structural urban pest issues, such as roaches, rodents, and flies. Pesticide use arranged by privately operated facilities by their subcontractors is not required to be reported and is not included in this report, which includes only pest management services contracted directly by DFTA. The agency reported that no pesticides were used during 2017.

Brooklyn Public Libraries

The Brooklyn Public Library (BPL) serves Brooklyn's 2.5 million residents, offering thousands of public programs, millions of books and use of more than 850 free Internet-accessible computers at its 66 locations. Contractors are hired for pest management as needed and the major pest infestations are roaches and mice. Table 6 summarizes pesticide use by pesticide type. Table 7 lists all pesticide products used by BPL in 2017.

Table 6: Types of Pesticides Used by BPL in 2017

Board of Elections

The Board of Elections is the administrative body that oversees elections through its staff at its main and five borough offices. The agency contracts for pest control through the city-wide contract administered by DCAS. Table 8 summarizes pesticide use by pesticide type. Table 9 lists all pesticide products used by BOE in 2017.

Chief Medical Examiner

Pesticide Use by NYC in 2017

The Office of Chief Medical Examiner (OCME) is responsible for investigating deaths in unusual circumstances, approving requests for cremation, providing additional forensic services to support criminal investigations, and managing all functions of the City mortuary. The agency contracts for pest control through the city-wide contract administered by DCAS. Table 10 summarizes pesticide use by pesticide type. Table 11 lists all pesticide products used by OCME in 2017.

City University of New York

The City University of New York (CUNY) is the nation's largest urban public university and consists of 23 institutions. The University serves more than 260,000 degree-credit students and 273,000 adult, continuing and professional education students. Individual institutions contracts for pest control services through private vendors. The data reported is information received from 15 colleges, Baruch College, Borough of Manhattan Community College, Brooklyn College, Bronx Community College, City College, College of Technology, The Graduate Center, Hostos Community College, John Jay College, Kingsborough Community College, La Guardia Community College, Lehman College, Medgar Evers College, Queens Borough Community College, and York College. Table 12 summarizes pesticide use by pesticide type. Table 13 lists all pesticide products used by CUNY in 2017.

Citywide Administrative Services, Department of

The Department of Citywide Administrative Services (DCAS) supports government recruitment, oversees surplus city-owned property and the commercial real estate portfolio for the City and provides supplies and equipment. Of the 14,000 city-owned lots, DCAS is directly

responsible for the management of approximately 2,400 of these properties. DCAS cleans and maintains 53 DCAS-managed buildings with 13,365,398 square feet of space throughout the city. These include City Hall, the four Borough Halls, the Manhattan and Brooklyn Municipal Buildings, and all state and municipal court buildings. DCAS manages the city-wide contract for pest management services which city agencies can buy into. This contract is effective from May 1, 2016 to April 30, 2017. Several agencies are housed in DCAS managed buildings and the report submitted reflects these applications. Table 14 summarizes pesticide use by pesticide type. Table 15 lists all pesticide products used by DCAS in 2017.

Corrections, Department of

The Department of Corrections (DOC) is responsible for New York City's inmates, housing the majority of them on Riker's Island. It oversees 44 facilities, including ten correctional facilities that have food preparation areas, laundries, residential areas for inmates, and office space. DOC does not employ contractors for pest management purposes, but relies on in-house pest control professionals and works with DCAS and HHC in maintaining certain facilities. Table 16 summarizes pesticide use by pesticide type. Table 17 lists all pesticide products used by DOC in 2017.

Education, Department of

The Department of Education (DOE) provides primary and secondary education to over 1 million pre-kindergarten to grade 12 students. Pest management at all New York City public Pesticide Use by NYC in 2017

schools is overseen by their Pest Control Unit. There are nineteen in-house licensed pest management professionals that conduct monthly monitoring inspections and respond to pest problems for approximately 900 schools. DOE contracts with several pest management companies to additionally provide services for an additional 300 schools. Table 18 summarizes pesticide use by pesticide type. Table 19 lists all pesticide products used by DOE in 2017.

Table 18: Types of Pesticides Used by DOE in 2017

Environmental Protection, Department of

The Department of Environmental Protection (DEP) has over 1,700 facilities upstate and downstate. These include water pollution control plants, well stations, pumping stations, shafts, chambers, reservoirs, aqueducts, tunnels, gate houses, office space, garages, repair shops, maintenance shops, and police precincts within New York City. DEP contracts for some pest control services and employ approximately 20 licensed applicators for upstate reservoir pest

control. Table 20 summarizes pesticide use by pesticide type. Table 21 lists all pesticide products used by DEP in 2017.

Fire Department

The Fire Department of New York City (FDNY) is responsible for the protection against fires and fire hazards and providing emergency medical services, technical rescue and response to various biological, chemical and radioactive hazards. It manages some 350 facilities throughout the City and contracts for pest control services. Table 24 summarizes pesticide use by pesticide type. Table 25 lists all pesticide products used by FDNY in 2017.

Health and Hospitals Corporation

The New York City Health and Hospitals Corporation (HHC) is a \$6.7 billion integrated healthcare delivery system with its own 420,000 member health plan, MetroPlus, and is the largest municipal healthcare organization in the country. HHC serves 1.4 million New Yorkers every year and more than 475,000 are uninsured. HHC provides medical, mental health and substance abuse services through its 11 acute care hospitals, four skilled nursing facilities, six large diagnostic and treatment centers and more than 70 community based clinics. HHC Health and Home Care also provide in-home services for New Yorkers. Because each facility is managed separately, pest control protocols differ among facilities. A few facilities have pest control professionals on staff, but the majority relies on outside contractors. Table 26 summarizes pesticide use by pesticide type. Table 27 lists products by pesticide types.

Health and Mental Hygiene, Department of

The Department of Health and Mental Hygiene (DOHMH) protects and promotes the health and mental well being of all New Yorkers. The Bureau of Veterinary and Pest Control Services at DOHMH protects the public from animal- and vector-borne diseases and other hazards, including those that result from uncontrolled or unregulated rodents and other animals, and from mosquito-borne pathogens. Two programs, Pest Control Services (PCS) and Vector Surveillance and Control (VSC) have pest management responsibilities. PCS focuses on rodent control – performing inspections, cleanups and treatments of both private and public property. Currently, PCS employs twenty-one pest management professionals to bait properties that have signs of active rodents with rodenticide placed either directly in rat burrows or in tamper resistant bait stations. Pest management in facilities operated by the DOHMH is done through private contractors. Though Local Law 37 requires the reporting of pesticide use on only public property, applications on private property done by PCS are included in Tables 24 and 25. VSC is charged with mosquito management and uses licensed pest management staff as well as outside contractors. Table 28 summarizes pesticide use by pesticide type. Table 29 lists all pesticide products used by DOHMH in 2017.

Homeless Services, Department of

The Department of Homeless Services (DHS) manages homeless shelters and dormitory facilities across the City. Of these, six are Family Services operated, five provide dormitory facilities for families with children and one facility, Preventative Assistance and Temporary Housing (PATH), is an intake facility. There are five adult facilities which also provide housing for men. DHS also operates and manages warehouses. Pest management services, which primarily address rodent and cockroach infestations, are provided by an outside contractor. Table 30 summarizes pesticide use by pesticide type. Table 31 lists all pesticide products used by DHS in 2017.

Housing Authority

The New York City Housing Authority (NYCHA) manages more than 2,400 residential buildings and more than 176,000 apartments, as well as office space and grounds that cover approximately 2,400 acres. NYCHA currently has a staff of some more than 100 pest management professionals that perform routine inspections and treatments, carry out specialized intensive IPM interventions, apply pesticides, and respond to complaints and requests from other agencies. NYCHA staff members regularly address a range of insect and rodent problems, including interior mice, cockroaches and bedbugs and exterior rats, weeds, and mosquito control. Table 32 summarizes pesticide use by pesticide type. Table 33 lists the products used by NYCHA in 2017.

Housing Preservation and Development

Housing Preservation and Development (HPD) oversees occupied and vacant residential and commercial buildings, vacant lots as well as a limited number of agency offices. In addition, its Emergency Repair Program occasionally encounters and responds to rats and fleas in occupied private buildings. There are no certified applicators on staff and the agency contracts for pest management services. Table 34 summarizes pesticide use by pesticide type. Table 35 lists all pesticide products used by HPD in 2017.

Human Resources Administration

The New York City Human Resources Administration/ Department of Social Services (HRA/DSS) provides temporary help to individuals and families with social service and economic needs to assist them in reaching self-sufficiency. HRA serves more than 3 million New Yorkers through essential and diverse programs and services. HRA/DSS has numerous offices and public service centers throughout the 5 boroughs. Table 36 summarizes pesticide use by pesticide type. Table 37 lists the products used by HRA/DSS in 2017.

New York Public Libraries

The New York Public Library (NYPL), through its 85 branches libraries services residents in the boroughs of Manhattan, the Bronx and Staten Island. Pest management is provided by private contractors. No application data was provided by NYPL for 2017.

Parks and Recreation

New York City's has 28,000 acres of parks, playgrounds, athletic fields, natural areas, recreational facilities, comfort stations, beaches, historic buildings, and parkways maintained by the Department of Parks and Recreation (DPR). The major pest issues facing DPR are weeds (including weed shrubs and weed trees) and rodents. Rarer infestations of exotic insect pests and diseases, often targeting trees, also occur. To address these, DPR employs 104 certified pesticide applicators. Herbicides account for the largest share of DPR's total pesticide use. Contractors are hired for pest management when peripheral rodent problems arise on capital projects.

This data includes pesticides applied on all city-owned golf courses. Local Law 37 exempts these locations from pesticide prohibitions. The table also includes the data from sister organizations that operate on DPR property such as zoos, conservancies, and botanic gardens. Table 38 summarizes pesticide use by pesticide type. Table 39 below lists for each pesticide type, all products used, unless there were more than 10, in which case the 10 most frequently applied products are listed. Appendix 2 includes a complete product listing for DPR.

Table 38: Types of Pesticides Used by DPR in 2017

Police Department

The Police Department (NYPD) is committed to providing a safe and secure environment for the public. It manages 76 precincts, 12 Transit Districts, and nine Housing Police Service Areas and other investigative and specialized units. The major pest issues facing its facilities are

structural pests and are managed by private contractors as needed. Table 40 summarizes pesticide use by pesticide type. Table 41 lists all pesticide products used by NYPD in 2017.

Sanitation, Department of

The Department of Sanitation (DSNY) manages garages, office buildings, transfer stations, and various publicly-owned lots throughout the city. DSNY employs two certified pesticide applicators that make routine visits to facilities and responds to emergency calls because of the nature of the agency's work – managing garbage – pest problems are endemic at some facilities. DSNY also contracts for weed control on some of the City's rights-of-way. Table 44 summarizes pesticide use by pesticide type. Table 45 lists the products used by DSNY.

Table 44: Types of Pesticides Used by DSNY in 2017

Taxi and Limousine Commission

The Taxi and Limousine Commission (TLC) licenses and regulates over 50,000 vehicles and approximately 100,000 drivers, performs safety and emissions inspections of the more than 13,000 medallion taxicabs three times each year, and holds numerous hearings for violations of City and TLC rules and regulations, making it the most active taxi and limousine licensing regulatory agency in the United States. The agency contracts for pest control through the city-wide contract administered by DCAS. Table 46 summarizes pesticide use by pesticide type. Table 47 lists all pesticide products used by TLC in 2017.

Transportation, Department of

The Department of Transportation (DOT) has a staff of over 4,000 that oversees one of the most complex urban transportation networks in the world. They manage approximately 5,800 miles of streets, sidewalks, and highways and 789 bridge structures, including six tunnels. They operate the Staten Island Ferry, oversee ferry operations on City-owned piers and operate approximately 75 facilities throughout the City. DOT is responsible for pest management at maintenance yards, lots, and agency offices throughout the city, as well as on rights-of-way along city highways. DOT is also contracted by New York State to provide right-of-way maintenance on state highways within city borders. Table 48 summarizes pesticide use by pesticide type. Table 49 lists all pesticide products used by DOT in 2017.

Table 48: Types of Pesticides Used by DOT in 2017
