Note: These population figures replace those published in the 1990 Vital Statistics Summary, and are based on the Census Bureau's modification of its data correcting the underreporting of race by persons of Hispanic ancestry. The major effects are a reduction of 60% in the total for Other and Unknown race and increases of 17% and 9% in the totals for whites and blacks, respectively. There were minor changes in age and sex as well.

*Persons of Hispanic ancestry may be of any race.

Table 3.

Deaths by Cause and Borough of Residence New York City, 1998

Cause (Codes from International Classification of Diseases, Ninth Revision, 1975)	Total	BOROUGH OF RESIDENCE						
		Manhattan	Bronx	Brooklyn	Queens	Richmond	Non-Residents	Residence Unknown
Total Deaths	61,010	11,169	9,592	17,869	14,639	3,365	3,957	419
All Natural Causes	58,531	10,762	9,183	17,163	14,093	3,249	3,759	322
1. Tuberculosis, all (010-018)	52	17	9	13	8	1	2	2
Tuberculosis of respiratory system (010-012)	33	8	6	10	6	1	-	2
Other tuberculosis (013-018)	19	9	3	3	2	-	2	-
2. Septicemia (038)	400	84	87	116	75	12	24	2
3. Human immunodeficiency virus (HIV) infection (042-044)	1,978	516	495	609	215	49	59	35
Acquired immunodeficiency syndrome (AIDS) (042)	1,932	505	484	597	208	47	57	34
Other HIV infections (043-044)	46	11	11	12	7	2	2	1
4. Viral hepatitis (070)	253	58	74	52	42	8	17	2
5. Pneumocystosis (136.3)	15	3	3	5	2	-	2	-
6. Other infective and parasitic diseases (Rest of 001-139)	111	25	30	29	15	1	10	1
7. Malignant neoplasms, all (140-208)	14,454	2,754	1,984	3,997	3,314	853	1,514	38
Lip, oral cavity and pharynx (140-149)	222	48	36	66	41	6	25	-
Digestive organs and peritoneum (150-159)	4,116	792	592	1,184	928	247	361	12
Stomach (151)	614	120	98	187	134	27	45	3
Colon (153)	1,499	278	205	437	356	104	116	3
Rectum (154)	198	38	27	57	46	14	15	1
Liver, bile duct, gallbladder (155-156)	608	125	83	181	136	26	56	1
Pancreas (157)	795	150	110	217	177	54	84	3
Respiratory and intrathoracic organs (160-165)	3,490	618	501	979	800	256	322	14
Trachea, bronchus and lung (162)	3,321	587	471	921	775	247	307	13
Kaposi's sarcoma (173.9)	18	6	2	3	2	2	3	-
Breast and genitourinary organs (174, 179-189)	3,679	736	481	1,010	892	191	362	7
Breast, female (174)	1,344	257	169	397	315	73	131	2
Cervix uteri (180)	152	30	26	44	34	6	12	-
Ovary and other uterine adnexa (183)	385	84	43	105	90	13	50	-
Prostate (185)	891	183	121	238	227	43	77	2
Bladder and other urinary organs (188-189)	588	119	78	129	154	43	63	2
Other and unspecified sites (Rest of 140-199)	1,476	315	183	376	328	77	193	4
Lymphatic and hematopoietic tissues (200-208)	1,453	239	189	379	323	74	248	1
Leukemia and aleukemia (204-208)	541	88	72	123	109	31	118	-
8. Benign and unspecified neoplasms (210-239)	202	29	23	58	46	14	30	2
9. Diabetes mellitus (250)	1,548	262	325	495	314	90	60	2
10. Alcohol dependence syndrome (303)	364	77	57	130	58	8	7	27
11. Drug dependence (304)	825	175	179	206	118	23	79	45
Drug dependence and accidental drug poisoning	843	180	180	209	120	23	81	50
12. Diseases of nervous system (320-389)	533	133	91	134	117	28	29	1
Alzheimer's disease (331.0)	82	32	14	16	17	2	1	-
13. Cardiovascular diseases, all (390-459)	28,755	4,707	4,223	8,763	7,863	1,673	1,416	110
Cerebrovascular disease (430-438)	1,998	419	374	535	471	97	94	8
Heart diseases (393-398, 402, 404-429)	25,486	4,043	3,619	7,853	7,126	1,507	1,239	99
Chronic rheumatic heart disease (393-398)	59	17	12	11	5	3	11	-
Ischemic heart disease (410-414)	19,505	2,734	2,508	6,118	5,889	1,282	930	44
Other forms of heart disease (420-429)	3,422	755	515	1,049	730	165	183	25
Hypertensive disease (401-404)	2,283	500	548	622	450	44	92	27
Atherosclerosis (440)	218	30	36	68	66	4	14	-
14. Pneumonia and influenza (480-487)	2,680	601	498	749	511	198	109	14
15. Chronic obstructive pulmonary diseases, all (490-496)	1,622	352	273	435	377	121	57	7
Bronchitis, emphysema (490-492)	197	65	14	50	42	10	15	1
Asthma (493)	250	44	77	58	52	7	12	-
16. Ulcer of stomach and duodenum (531-533)	141	26	28	35	37	5	8	2
17. Appendicitis (540-543)	13	2	5	3	2	1	-	-
18. Intestinal obstruction and hernia (550-553, 560)	92	25	15	18	26	1	5	2
19. Chronic liver disease and cirrhosis (571)	684	117	143	192	148	26	47	11
20. Nephritis, nephrotic syndrome and nephrosis (580-589)	413	83	44	149	93	22	19	3
21. Hyperplasia of prostate (600)	5	-	1	1	3	-	-	-
22. Complications of pregnancy, childbirth and the puerperium (630-676)	16	4	4	7	-	1	-	-
23. Congenital anomalies (740-759)	306	48	48	76	62	12	60	-
24. Certain conditions originating in the perinatal period (760-779)	496	80	78	181	108	14	35	-
25. Sudden infant death syndrome (798.0)	35	4	7	16	7	-	1	-
26. Symptoms, signs and ill-defined conditions (Rest of 780-799)	127	26	20	46	25	3	3	4
Pending final determination (799.9)	14	4	2	4	2	-	-	2
27. All other diseases	2,411	554	439	648	507	85	166	12
All External Causes	2,479	407	409	706	546	116	198	97
Firearms	516	56	129	178	85	20	42	6
28. Total accidents (E800-E949)	1,145	181	147	321	299	66	96	35
Accidental drug poisoning	18	5	1	3	2	-	2	5
Motor vehicle accidents (E810-E825)	387	41	42	127	106	29	34	8
Home accidents	390	67	55	111	112	19	22	4
29. Suicide and self inflicted injuries (E950-E959)	524	123	70	122	119	34	45	11
30. Homicide and legal intervention (E960-E969, E970-E978, E990-E999)	675	89	168	223	109	14	49	23
31. Injury undetermined whether accidentally or purposely inflicted (E980-E989)	135	14	24	40	19	2	8	28

Note: Accidental drug poisoning codes include E850.0, E854.1, E855.2 and E858.8.
Firearm codes include E922, E955.0-E955.4, E965.0-E965.4, E970, and E985.0-E985.4.

Table 4.

Chief Causes of Death in Specified Age Groups by Sex New York City, 1998

Males			Females	
Deaths	Percent		Deaths	Percent
ALL AGES				
11,261	38.1	Heart Diseases	14,225	45.2
7,014	23.7	Malignant Neoplasms	7,440	23.7
1,237	4.2	Pneumonia and Influenza	1,443	4.6
781	2.6	Cerebrovascular Disease	1,217	3.9
1,358	4.6	Human Immunodeficiency Virus Infection	620	2.0
745	2.5	Chronic Obstructive Pulmonary Disease	877	2.8
670	2.3	Diabetes Mellitus	878	2.8
735	2.5	Accidents Except Drug Poisoning	392	1.2
659	2.2	Drug Dependence and Accidental Drug Poisoning	184	0.6
500	1.7	Chronic Liver Disease and Cirrhosis	184	0.6
4,598	15.6	All Other Causes	3,992	12.7

Note: The ten leading causes of death in each ethnic group for both sexes combined are arranged in decreasing order of frequency.

Totals may not equal 100% due to rounding. Decedents of other and unknown ethnicities are not shown.

See the Technical Notes for a discussion of HIV Infection and AIDS as the cause of death.

Table 5.

Deaths and Death Rates per 100,000 Population from Selected Causes by Health Center District of Residence, New York City, 1998

Health Center District	Population April 1, 1990	All Causes		Heart Diseases		Malignant Neoplasms		HIV Infection		Pneumonia and Influenza		Cerebrovascular Disease		Chronic Obstructive Pulmonary Diseases		Chronic Liver Disease & Cirrhosis		Diabetes Mellitus		Drug Dependence & Accidental Drug Poisoning		Accidents Except Drug Poisoning		Suicide		Homicide		Injury Undetermined

Note: For 1983-1986, only AIDS was recognized as a cause of death and coded 279.1; beginning in 1987, AIDS is coded 042 and other HIV infections are coded 042-044. In 1982, 30 deaths were attributed to AIDS.

Tables showing deaths due to AIDS alone for 1983-1996 can be found in the Vital Statistics Summaries for 1987-1996.

See the Technical Notes for a discussion of HIV Infection and AIDS as the cause of death.

Table 13.

Characteristics of Decedents With Selected Causes of Death, New York City, 1998

Note: Rates for 1979-1981 and 1989-1991 are based on deaths to New York City residents only, regardless of place of occurrence, while those for previous years included all events in New York City, regardless of the residence of the decedents. See Technical Notes.

For 1901-1903 and 1909-1911 rates are adjusted for age and sex. For other years, rates are adjusted for age, sex and race (white and others). Standard is United States population, 1940.

* Data are not available or not applicable until a later time period.

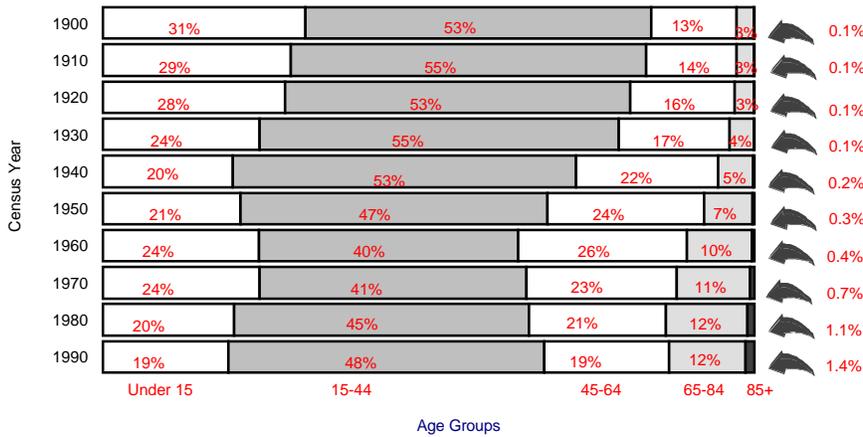

Figure 1. Changes in Age Composition of the Population New York City, 1900-1990

The age composition of the New York City population reflects changes in life expectancy, and natural historic trends. From 1900 to 1990, the proportion of city residents age 45 and over doubled, from 16% to 32%; the increase was greatest in the oldest age group, those 85 & over. The effect of the economic depression of the 1930's on the number of live births is seen in the lower percentage of residents under age 15 in 1940, while the post World War II baby boom increased this segment rapidly after 1950.

Figure 2. Age and Sex Composition of the Population New York City, 1990

This age-sex pyramid shows that there are more females than males in the New York City 1990 population, and that the excess is greater at older ages. The smaller segment of both males and females in age group 5-9 years reflect the lower number of births in the early 1980's, compared to the larger number in the second half of the 1980's.

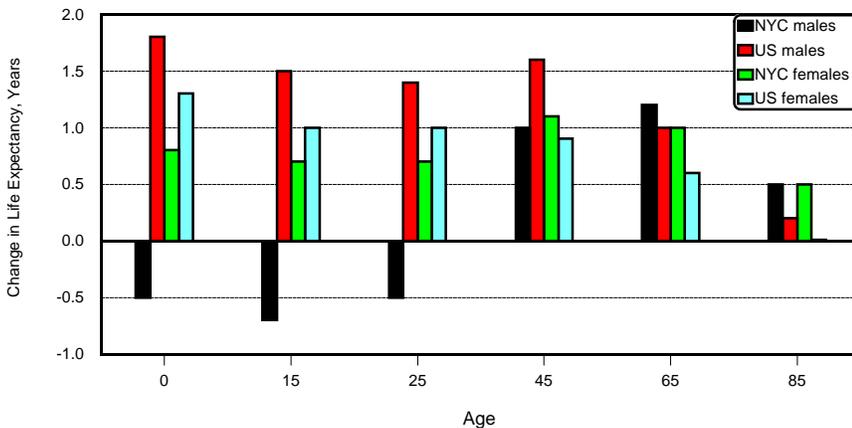

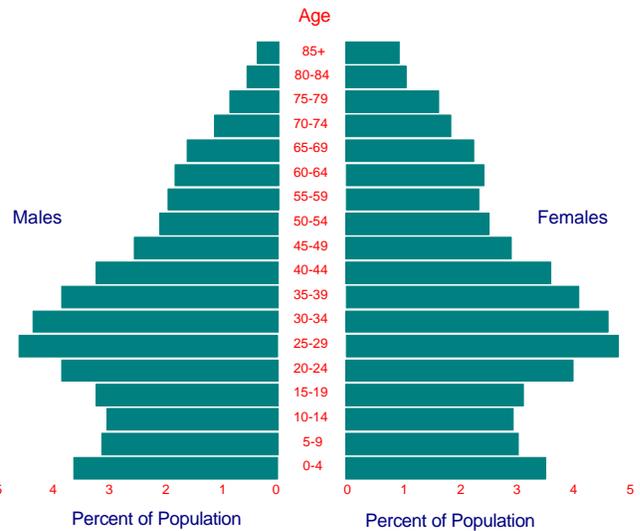

Figure 3. Changes in Life Expectancy at Selected Ages by Sex, 1980 and 1990 New York City and United States

Between 1980 and 1990, life expectancy for male New York City residents at birth, at ages 15 and 25 declined about one half year, while life expectancy for all United States males at these ages increased about one and one half years. Life expectancy for New York City females increased but less than for all United States females. At selected older ages New York City male residents showed somewhat greater increases in life expectancy than did males nationwide. New York City female residents achieved greater gains in life expectancy than did all United States females at these later ages. The decline in life expectancy among New York City males has been attributed to deaths due to HIV and related infections.

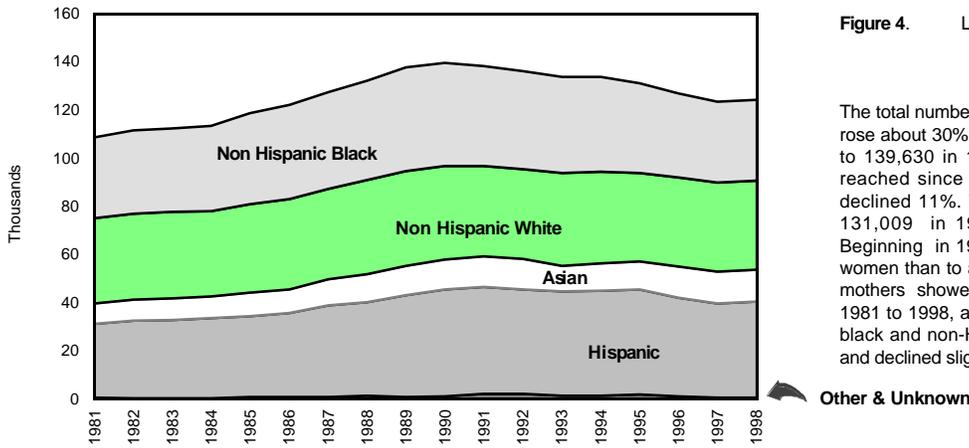

Figure 4. Live Births by Mother's Ethnic Group
New York City, 1981-1998

The total number of live births registered in New York City rose about 30% during the 1980's from 108,547 in 1981 to 139,630 in 1990. This was the highest number reached since 1970. During the 1990's, live births declined 11%. The largest year-to-year decline, from 131,009 in 1995 to 126,901 in 1996, was 3.1%. Beginning in 1990, there were more births to Hispanic women than to any other ethnic group. Births to Asian mothers showed the largest proportional increase from 1981 to 1998, almost 56%. Births to both non-Hispanic black and non-Hispanic white women peaked in 1989, and declined slightly thereafter.

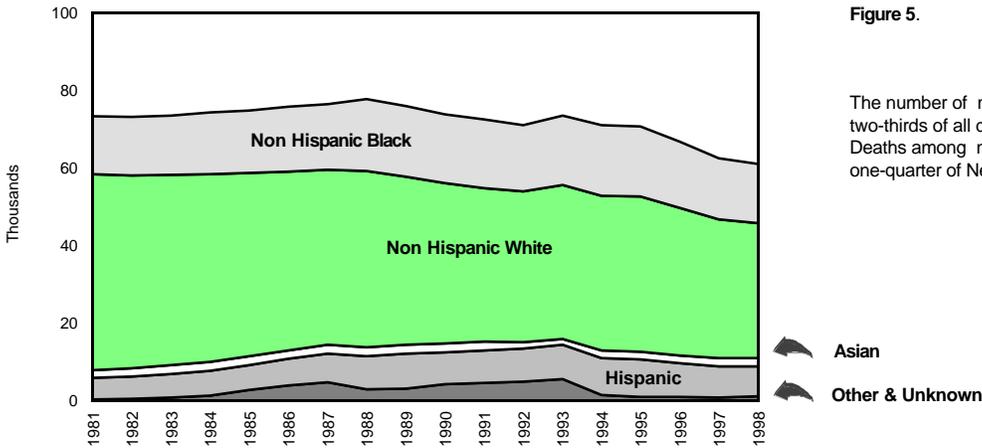

Figure 5. Deaths by Ethnic Group of Decedent
New York City, 1981-1998

The number of non-Hispanic white decedents declined from two-thirds of all decedents to just over half from 1981 to 1998. Deaths among non-Hispanic blacks now constitute about one-quarter of New York City deaths.

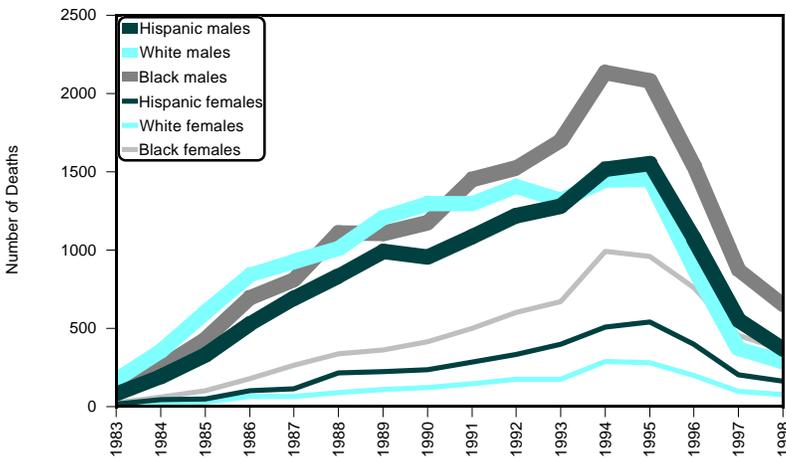

Figure 6. Deaths Due to HIV Infection
by Sex and Selected Ethnic Group
New York City, 1983-1998

The number of deaths due to HIV infection declined 72% from 1994 to 1998. Deaths declined 74% among males and 66% among females. Deaths declined among all ethnic groups as well. The decline is attributed to the introduction of new drugs, protease inhibitors, and to increased access to medical care under the Ryan White Care Act. Depictions of deaths due to AIDS only for 1983-1996 can be found in the New York City Vital Statistics Summaries for 1991-1996. See the Technical Notes for a discussion of HIV infection and AIDS as the cause of death.

** Data are not available or not applicable until a later time period.

(1) Numbers following causes are codes of the International Classification of Diseases, Ninth Revision.

fetal deaths 28 weeks and over + infant deaths under 7 days

(2) Perinatal mortality rate = $\frac{\text{fetal deaths 28 weeks and over} + \text{infant deaths under 7 days}}{\text{live births}} \times 1,000$

fetal deaths 28 weeks and over + live births

(3) AIDS was first reported as a cause of death in 1982, and coded 279.1 until 1986. Beginning in 1987, HIV infections are coded 042-044.

See the Technical Notes for a discussion of HIV Infection and AIDS as the cause of death.

(4) Rate per 100,000 population under 5 years of age.

(5) Accidental drug poisoning includes ICD codes E850.0, E854.1, E855. 2, E858. 8.

(6) Data for 1982-1985.

(7) Rate less than 0.05.

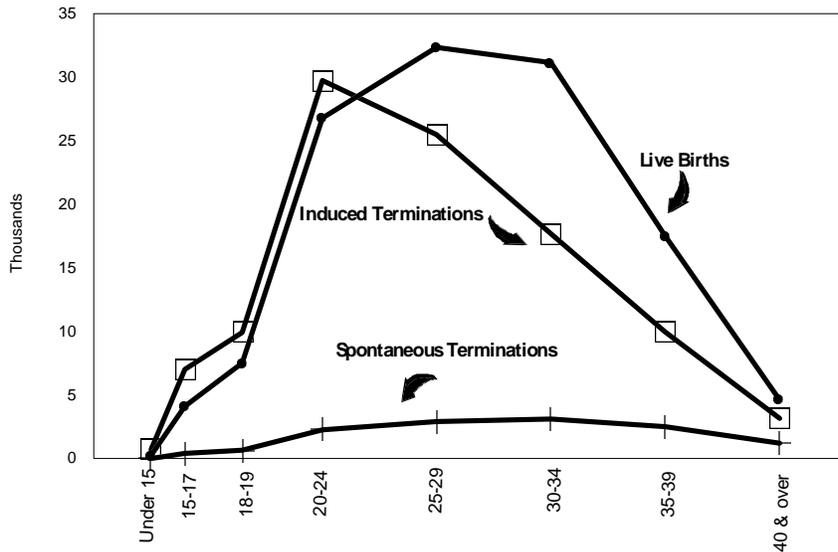

Figure 7. Live Births, Induced Terminations and Spontaneous Terminations of Pregnancy by Age of Woman, New York City, 1998

There are almost 250,000 pregnancy outcomes reported in New York City annually. Over half are live births, about 43% are induced terminations and the remainder are spontaneous terminations, or fetal deaths. (The number of spontaneous and induced terminations reported depend on active surveillance.) For women age 24 and younger, the outcome is more likely to be an induced or spontaneous termination than a live birth. Women age 30-34 and 35-39 are about 50% more likely to have a live birth than an induced or spontaneous termination.

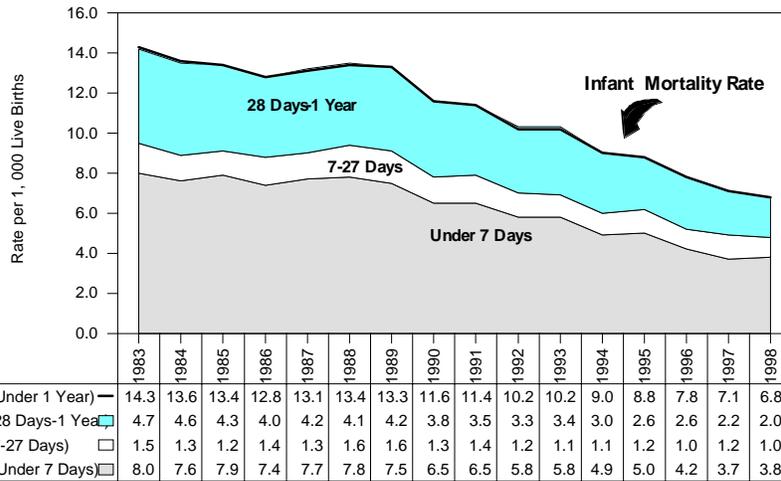

Figure 8. Infant, Neonatal and Post-neonatal Mortality Rates, New York City, 1983-1998

The New York City infant mortality rate has declined 52% since 1983. The largest drop, 13%, occurred from 1989 to 1990. Currently, about 55% of the infant deaths occur in the early neonatal period (under seven days of age), about 15% in the late neonatal period (7 to 27 days) and about 30% from 28 days through the remainder of the first year of life. Post-neonatal deaths have declined somewhat more than neonatal deaths.

(1) Puerto Rican and other Hispanic ethnicities are based on ancestry, regardless of race. Prior to 1993, Asian ethnicity is based on ancestry; beginning in 1993, Asian ethnicity is based on race.

Those of other ancestries are classified as Other White, Other Black, Other and Unknown based on race. See Technical Notes for a discussion of race, ancestry and ethnicity.

(2) In the absence of a matching birth certificate for an infant death, the information on the death certificate is used to assign a maternal ethnic group. The assignment for the years 1992-1996 has been corrected, resulting in infant mortality rates for other whites and other blacks slightly higher than those published previously, and in fewer infant deaths with mother's ethnic group unknown.

(3) Rate per 1,000 live births.

(4) Rate per 10,000 live births.

Note: Figures include reports through September 1999; data for recent years are incomplete due to reporting lag.

Special Section: Selected Vital Statistics by Community District of Residence, 1998

Community districts were established by City Charter mandate and implemented in 1969 for purposes of planning, local participation in city government and delivery of city services. The availability of Vital Statistics data by community district may be useful for comparison with other New York City data.

*Rate per 1,000 population.

**Rate per 1,000 live births.

VITAL EVENTS - Vital event data reported here are based on occurrences in New York City to both residents and non-residents. Tables that include a geographic breakdown for residents show non-resident and residence-unknown data separately. Where there is no geographic breakdown, all New York City occurrences are included. Counts of births, deaths and induced and spontaneous terminations of pregnancy are based on certificates filed with the Office of Vital Records, New York City Department of Health. With implementation beginning in 1995 and completed by the end of 1996, birth certificates are created, printed and filed using the Electronic Birth Certificate (EBC) system. The number of induced and spontaneous terminations of pregnancy reported each year depends to some extent on the level of active surveillance by the Office of Vital Statistics. Some events from earlier years filed too late for inclusion in the year of occurrence are included in each year's annual statistical reports; see Induced Terminations of Pregnancy below. ! The number of marriages shown in Table 1 and in Figure 9 is the number of marriage licenses issued by the City Clerk. Tables 14, 15 and 16 also use outside data sources; see Life Expectancy below. ! For public health purposes, the demographic and medical information on the certificates is coded in general agreement with standards developed by the National Center for Health Statistics (NCHS). In some instances, such as Ancestry of decedent or mother, New York City data are more detailed. ! Because New York City law prohibits recording mother's marital status on the birth certificate, it is calculated using other items; see Mother's Marital Status below.

POPULATION - Population data are census figures provided by the New York City Department of City Planning and the New York State Department of Health. In Table 1, the population figures for census years (1960, 1970, 1980 and 1990) are census counts; for intercensal years straight-line interpolations are used. Rates in this and other tables that show 1990 census figures may be out-dated. ! The corrected data in Table 2a are based on the Bureau of the Census's MARS File (Modified for Age, Race and Sex). The primary change is the allocation to a race category of over 900,000 New York City residents of Hispanic ancestry who did not report a race in the census; the number of New York City residents in the race category other and unknown declined from 1,392,964 to 556,918, while the number of whites increased by almost 650,000 and the number of blacks by almost 190,000. There were also some minor corrections in the age and sex distributions.

LIFE EXPECTANCY, AGE SPECIFIC AND ADJUSTED DEATH RATES - Life expectancy tables summarize the effect of mortality rates prevailing at a specific time on persons being born or living at that time. Tables may be computed for population subgroups, most often males and females and race groups. The components required are counts and mortality figures for the desired subgroups. Life expectancy tables are presented for census years, which are when the population data are available. The mortality experience for the census year and for the year before and the year after is used to smooth statistical variation. ! The

same two sets of data, population and mortality, are used to prepare average yearly age-sex-specific death rates for the three years (Table 15). Finally, the mortality data are separated into cause groups, and used to calculate average yearly age-sex-race adjusted death rates (Table 16). Adjustment allows comparisons between rates to be made over time or between geographic areas by eliminating the effects of differences in the composition of the populations. ! A change in the data used for the 1980 and 1990 calculations is noted in Tables 15 and 16 by a line separating these rates from those for earlier years. The calculations for 1980 and 1990 used information on all deaths occurring to New York City residents regardless of place of occurrence (obtained from the New York State Department of Health), whereas previous computations used all deaths occurring in New York City regardless of residence of the decedent. The new data were also used to compute 1980 life expectancy tables to facilitate comparisons with 1990 figures. ! Life expectancy tables for Hispanics were not calculated because of under-reporting of Hispanic ancestry on death certificates; technical changes in the death certificate were made in 1993 to correct this problem.

RACE, ANCESTRY AND ETHNICITY - Race and Ancestry are separate items on the certificates, reported usually by a parent on the birth certificate, and by a relative of the decedent or by the funeral director on the death certificate. Responses are coded in general conformance to rules of NCHS. ! In 1992, five additional codes for Asian and Pacific Islander races were added, following their introduction by NCHS: Asian Indian, Guamanian, Korean, Samoan and Vietnamese. Codes previously used include Chinese, Filipino, Hawaiian, Japanese and other. ! A new method of assigning Asian ethnicity was introduced in 1993, using Asian race rather than Asian ancestry as was done in the past. The ordered selection rules first assign Puerto Rican or other Hispanic ethnicities based on ancestry, regardless of race. Then, those of other ancestries are classified by race as Asian, other white, other black, other or unknown. This change is made to take advantage of the expanded Asian race categories introduced in 1992. ! In certain instances, the item Birthplace is used to remove ambiguity in the Race item. ! Persons whose race is black and whose ancestry is American are classified as being of African-American ancestry. ! Table 7, Deaths by Ancestry and Borough of Residence and Table 21, Live Births by Ancestry and Borough of Residence, present data for ancestry groups having 500 or more births or deaths; groups are not deleted from the tables if their numbers decline. Ancestry is defined by NCHS as the nationality, lineage, or country where the subject's ancestors were born before their arrival in the United States; if a religious group is reported, NCHS instructions are to ask for the country of origin or nationality. In New York City, enough certificates with ancestry reported as Jewish or Hebrew are received to warrant inclusion in these tables, notwithstanding the religious meaning of the terms.

CAUSE OF DEATH - Cause of death information presented is the underlying cause of death on each certificate, selected using rules issued by NCHS and

codes of the International Classification of Diseases, Ninth Revision, implemented in 1979. Earlier revisions and the year their codes were implemented are the Fifth, 1939; Sixth, 1949; Seventh, 1959; and Eighth, 1969. Long term trends in causes of death should be interpreted with caution because of possible change in causes and groupings with each revision. Changes are occasionally made to terms used to describe causes of death, and rarely changes are made in the defining ICD codes. ! Beginning in 1996, Alzheimer's disease and deaths due to firearms are shown separately, following NCHS practice.

HIV and AIDS Mortality - Beginning in 1997, the mortality data presented in most tables of this Vital Statistics Summary were expanded to include all deaths due to HIV infection (042-044), not only AIDS (042). From 1983 through 1986, AIDS and other HIV deaths were assigned code 279.1. In 1987, NCHS introduced code 042 for AIDS and 043-044 for other deaths due to HIV, and they have been reported this way in Table 3 since then. The number of other HIV deaths by year is shown below.

1987 - 33	1988 - 34	1989 - 89
1990 - 137	1991 - 209	1992 - 197
1993 - 118	1994 - 146	1995 - 92
1996 - 52		

! Beginning in 1997, Tables 4 and 4a, 5, 12, 13 and 17, and Figure 6, show all deaths due to HIV infection. The historic data in Tables 12 and 17 and in Figure 6 have been expanded as well. Tables 3 and 16 display data for AIDS and other HIV infection deaths separately. ! The incidence data in Table 34 are provided by the New York City AIDS Surveillance Registry. Their active surveillance system identifies persons diagnosed with AIDS, a reportable disease in New York State. **Deaths Due to Drug Abuse** - Revised procedures at the Office of Chief Medical Examiner in 1989 led to a substantial portion of deaths related to drug use being classified as accidental drug poisonings. In prior years, virtually all such deaths were classified as due to drug dependence. In order to maintain continuity with previously published vital statistics, three new categories have been added to various tables: accidental drug poisoning to Tables 3, 8 and 17; accidents except drug poisoning to Tables 4, 5 and A; and drug dependence and accidental drug poisoning to Tables 3, 4, 5 and A. ! Deaths due to accidental drug poisoning are those assigned to one of the following four ICD-9 codes: E858.0, opiates and related narcotics; E854.1, psychodysleptics; E855.2, local anesthetics; E858.8, other drugs and combinations. Deaths due to drug dependence are assigned to code 304. ! The new category drug dependence and accidental drug poisoning is the most useful for analysis of trends.

Maternal Deaths - Maternal deaths are those with underlying causes assigned to codes 630-679, complications of pregnancy, childbirth and the puerperium (the six-week period following childbirth). These codes are assigned only if death occurs within 42 days of delivery.

External Causes of Death - External causes of death include accident, suicide, homicide, legal intervention, injury undetermined whether accidentally or purposely inflicted and injury resulting from operations of war. Some homicides are considered justifiable and are reported as such by the New York City Police

TECHNICAL NOTES, 1998

Department under the Uniform Crime Reporting System of the Federal Bureau of Investigation. Deaths due to legal intervention have been included in the homicide figures reported in the Vital Statistics Summary, and have been identified in the detailed homicide table. Deaths due to injury resulting from operations of war have also been included in the homicide total; these are infrequent, only one having been reported from 1984 through 1996, and are not specifically identified. ! All death certificates for external causes are reported by the Office of Chief Medical Examiner. Deaths for which a cause has not been determined by the time the statistical file is closed are shown separately in Table 3; some of these pending deaths will be determined to be due to natural causes. This number has declined since 1989. ! The introduction of the category injury undetermined in 1969 affected the number of deaths classified as accidents or suicides; any discussion of trends in these causes should take this change into account. The number of deaths classified as injury undetermined has declined since 1989, but they should be considered in analysis of deaths due to external causes. ! The classification of accident types in Tables 3 and 8 is based on categories developed by the National Safety Council, which emphasize the site of the accident. However, deaths due to firearms and to accidental drug poisoning are shown separately, regardless of site.

Fatal Occupational Injuries - The Census of Fatal Occupational Injuries, which provides the data in Table 7a, is carried out according to a protocol developed by the Bureau of Labor Statistics (BLS) of the U.S. Department of Labor. Autopsy and other reports for deaths due to external causes (see above) are reviewed if the injury occurred at work. Definitions and terminology are those of BLS, which may differ from those generally used in vital statistics.

Infant Mortality - The infant mortality rate consists of the number of infant deaths in New York City in a specified year divided by the number of live births in the city in the same year; some infants in the numerator were born in the preceding year, and some in the denominator will die in the following year. The same definition applies to geographic subdivisions included in some tables. ! In this summary, all characteristics of infant deaths are drawn from the death certificate except in Table 32, which uses the ethnic group of the mother from the child's birth certificate. In Tables 29 and 30, maternal risk factors and birth weight are based on the birth certificates.

BOROUGH OF RESIDENCE - Borough of residence and other geographic classifications are based on the usual residence reported in the certificate. As of 1990 deaths of nursing home residents are assigned to the

area where the nursing home is located, as residents of nursing homes are included in census figures. Prior to 1990, these deaths were reported in a separate category, Residents of Institutions.

PLACE OF DEATH - In reporting Place of Death in Table 6, the term hospital includes residential units, hospices and other special facilities within the hospital. Nursing home includes only sites licensed as Extended Care Facilities by the State of New York. Home includes, in addition to private houses and apartments, group quarters for special populations, homes for adults and other long-term residential sites.

PLACE OF BIRTH - Reporting of home births in Tables 22 and 23 was corrected in 1996 to include events where the certificate was filed through a hospital. For 1995, the number of home births was 762, not 249 as previously reported.

MOTHER'S MARITAL STATUS - New York City is prohibited by local law from recording mother's marital status on the record or report of birth. For purposes of statistical analysis and reporting, it has been computed from other information on the birth certificate, by coders using an algorithm developed by NCHS and more recently, an algorithm adapted to EBC. In 1996, a review of the results led to the conclusion that the number of nonmarital births was being overestimated. A new method was implemented by an EBC change in 1997. ! The new method uses only the presence or absence of a father's name on the birth certificate and the filing of an acknowledgment of paternity to estimate marital status; a comparison of the surname of the parents was dropped. The new procedure is consistent with that used by New York State. ! More than 91,000 records of 1997 birth certificates were coded using both methods. The overall change in the proportion of unmarried mothers was a decline of 19.2 percent, from 53.2 percent to 43.0 percent. The decline was greater among older women, and varied by ethnic group and type of hospital of delivery as well. These differences contributed to a range of changes across health center districts. ! A complete discussion may be found in the Special Note on Mother's Marital Status in the 1997 Vital Statistics Summary. This characteristic of live births should be analyzed cautiously.

INDUCED TERMINATIONS OF PREGNANCY - Induced Terminations of Pregnancy generally require active surveillance and follow-up to insure complete reporting. As a result, some events from earlier years are included in each year's Vital Statistics Summary. In 1997, one facility was found to have failed to submit reports for over 11,000 1996 procedures. These

reports, and about 500 from several other facilities, were reported in revised tables for 1996 pregnancy outcomes in the 1997 Vital Statistics Summary. A discussion of the revised tables and the corrected data for all pregnancy outcomes can be found in the Technical Notes, 1997.

COMMUNITY DISTRICTS -- Community districts were established by City Charter in 1969 for the delivery of city services. Population figures for these districts are compiled by the Department of City Planning from census data. ! There are 59 community districts, referred to by their borough and sequence number, compared to 30 health center districts, which have neighborhood names. The number of districts in each system by borough is shown below.

<u>Borough</u>	<u>HCD</u>	<u>CD</u>
Manhattan	7	12
Bronx	6	12
Brooklyn	10	18
Queens	6	14
Staten Island	1	3

There is no translation from one system to the other. ! In establishing population figures for community districts, census totals for counties are kept as borough totals, while the district figures are compiled from census tract and census block data. Borough boundaries are not always followed, so the sum of the community district populations in each borough does not equal the borough population or the city-wide population. ! The numbers of births and deaths to Manhattan and Bronx residents differ between health center district tables and community district tables because the northernmost Manhattan neighborhood of Marble Hill is in Manhattan under the health center district organization and in the Bronx under the community district system. The population-based rates may change as well. For example, in 1998, 41 deaths were reassigned from Manhattan to the Bronx, as seen in Table 5 and Table A: the Manhattan death rate for all causes did not change from 7.5 per 1,000 population, but the rate for heart disease deaths changed from 271.8 per 100,000 population to 270.9. For 1998 births, 126 events were reassigned, as shown in Table 24 and Table B: the Bronx birth rate changed from 17.9 per 1,000 population to 18.0. ! The population of Riker's Island, site of New York City Department of Correction facilities, is in the Bronx for health center district purposes and in Queens in the community district system. The small number of vital events to residents have been assigned to Queens in both systems. ! A description of the construction of community district geography will be found in Department of City Planning, Demographic Profiles, DCP # 92-32-Revised, pp. 293-297.

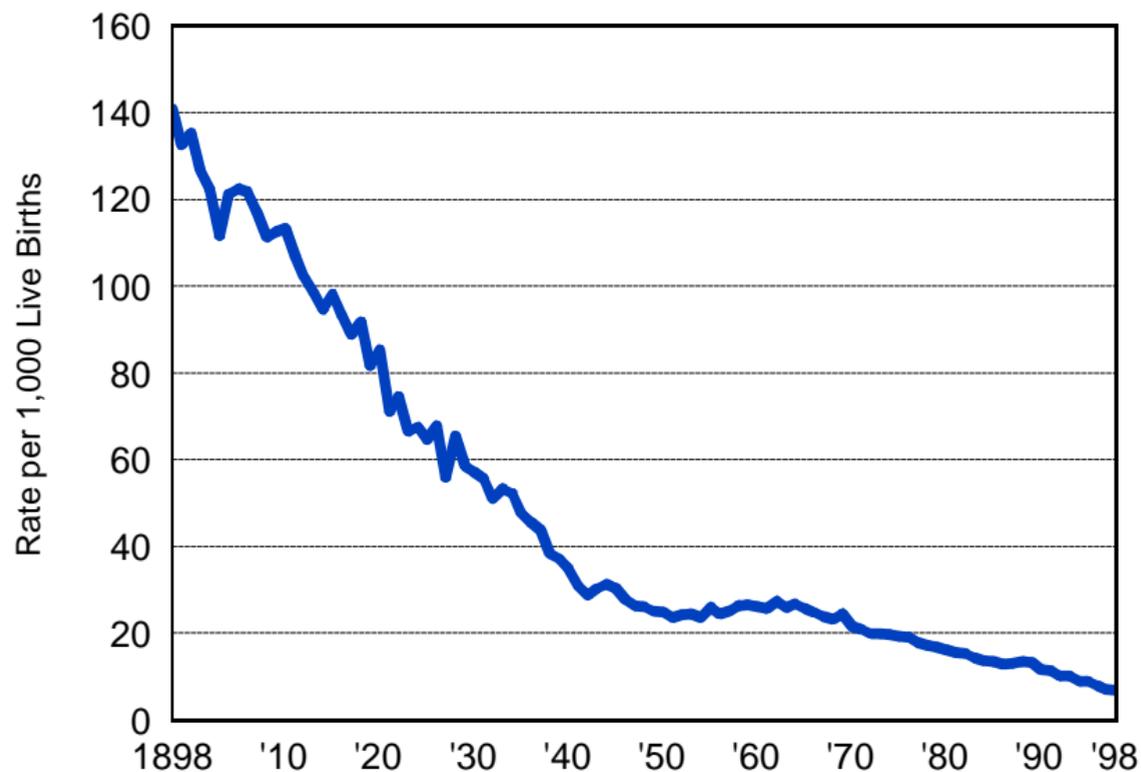

Figure 11. Infant Mortality Rate

New York City, 1898 to 1998

New York City took its present form in 1898, when New York City's boundaries were extended to include all five boroughs, Manhattan, Bronx, Brooklyn, Queens and Staten Island. The infant mortality rate at that time was estimated at 136.7 deaths under one year of age per 1,000 live births. (Because of incomplete reporting of early neonatal deaths, this is almost certainly an underestimate.) Improvements in food and water safety in the earlier part of the century, and in access to medical care advances in the later years, have contributed to the decline to 6.8 deaths per 1,000 live births.

Rates and Ratios Defined

The numerators of the rates in these tables are events occurring in New York City and reported during the year, unless otherwise specified. The denominator is the resident population figure from the 1990 census, including all ages and both sexes, unless otherwise specified.

Live Birth Rate - The number of live births per 1,000 population.

$$\frac{\text{Live Births}}{\text{Population}} \times 1,000$$

Marriage Rate - The number of marriages per 1,000 population.

$$\frac{\text{Marriages}}{\text{Population}} \times 1,000$$

Infant Mortality Rate - The number of infant (under one year of age) deaths per 1,000 live births.

Neonatal Mortality Rate - The number of neonatal (under 28 days) deaths per 1,000 live births.

Post-neonatal Mortality Rate - The number of post-neonatal (28 days to under one year of age) deaths per 1,000 live births.

$$\frac{\text{Infant Deaths}}{\text{Live Births}} \times 1,000$$

Fetal Death Ratio - The number of fetal deaths of 28 weeks gestation and over per 1,000 live births.

$$\frac{\text{Fetal deaths 28 weeks and over}}{\text{Live Births}} \times 1,000$$

Perinatal Mortality Ratio - The number of fetal deaths of 28 weeks gestation and over plus the number of early neonatal (under seven days) deaths per 1,000 fetal deaths of 28 weeks gestation and over plus live births.

$$\frac{(\text{Fetal deaths 28 weeks and over} + \text{Infant deaths under 7 days})}{\text{Fetal deaths 28 weeks and over} + \text{Live Births}} \times 1,000$$

Death Rate, all causes - The number of deaths per 1,000 population.

$$\frac{\text{Deaths all causes}}{\text{Population}} \times 1,000$$

Death Rate, specified causes - The number of deaths due to a specified cause per 100,000 population.

Death Rate, age and sex specific - The number of deaths of persons of specified age and sex per 1,000 population of the specified age and sex.

Death Rate, age, sex and race adjusted - The number of deaths per 100,000 standard population. Age, sex and race specific death rates are applied to a standard population, eliminating the effect of differences in population composition, and allowing comparisons over time or between geographic areas.

Maternal Mortality Ratio - The number of deaths due to complications of pregnancy, childbirth and the puerperium occurring within 42 days of delivery per 10,000 live births.

Figure 12. Health Center Districts and Boroughs, New York City

HIGHLIGHTS, 1998

COMMUNITY DISTRICTS - A special section in this Summary, pages 32–35, contains a map of the 59 New York City community districts and two new tables, deaths and live births by community district of residence. Community districts were implemented in 1969 as the geographic units for organizing and delivering city services.

BIRTHS - The number of registered live births occurring in New York City increased one percent, from 123,313 to 124,252. This is the first increase in the number of live births since 1990. The number and percentage of births to teenagers continued to decline, with the number for young teens aged 15-17 falling six percent, and the number for teens aged 18-19 years increasing four percent. Nationally, the birth rate for teenagers has declined from 1991 to 1998. The number of births for women aged 40 and over was the highest since 1975. This also follows a national trend.

DEATHS - The total number of deaths occurring in New York City in 1998 reached a record low, two percent below the number for 1997: a decline of 1,496 from 62,506 to 61,010. The decline in New York City homicide deaths continues, dropping from 793 in 1997 to 675 in 1998, a decline of 15%, to the lowest number of homicide deaths since 1975. For the first time since 1975, homicide is not among the 10 leading causes of death. Three-quarters of the decline is in homicides by firearms. Since 1994, the number of HIV deaths has declined 72%, with a 25% drop between 1997 and 1998. A similar decline is occurring nationwide. The number of infant deaths and the infant mortality rate (deaths under one year of age per 1,000 live births)

both continued to decline, reaching 843 deaths and a rate of 6.8, the lowest level in New York City's history.

HIV - Reporting of deaths due to Human Immunodeficiency Virus (HIV) infection in most tables now includes all deaths due to HIV, and not only AIDS. In 1998, the expanded category was the fifth leading cause, with 1,978 deaths: AIDS alone had 1,932 deaths.

MARRIAGE LICENSES - The number of marriage licenses issued in New York City by the city clerk decreased 25% from 1997 to 1998, from 80,027 to 53,661. This follows an increase of more than 10% from 1995 to 1996 and 1997, due perhaps to anticipated changes in federal immigration and welfare legislation.

1997 CHANGES - Beginning in 1997, the reporting of deaths due to Human Immunodeficiency Virus (HIV) infection included all deaths due to HIV, and not only AIDS. A revision of the method of computing the marital status of women delivering infants, to correct an overestimation of nonmarital births, resulted in a decline of about 19% in the proportion of infants born to unmarried women. Discussion of these changes appears in the 1997 Technical Notes and Special Note on Mother's Marital Status. The Vital Statistics Summary, 1997 also contained revised tables for 1996 Induced Terminations of Pregnancy, and introduced new tables on Chief Causes of Death in Specified Ethnic Groups, and an improved map of health center districts.
