85 & Over	98,343	27,971	70,372	23,525	59,096	3,576	10,004	870	1,272	8,060	2,503	5,557

Note: These population figures replace those published in the 1990 Vital Statistics Summary, and are based on the Census Bureau's modification of its data correcting the underreporting of race by persons of Hispanic ancestry. The major effects are a reduction of 60% in the total for Other and Unknown race and increases of 17% and 9% in the totals for Whites and Blacks, respectively. There were minor changes in age and sex as well.

*Persons of Hispanic ancestry may be of any race.

Deaths by Cause and Borough of Residence
New York City, 1992

Cause (ICD-9 Code*)	BOROUGH OF RESIDENCE							
	Total	Manhattan	Bronx	Brooklyn	Queens	Richmond	Non-Residents	Residence Unknown
Total Deaths	71,001	14,013	11,770	20,688	16,259	3,261	4,229	781
All Natural Causes	66,728	13,254	10,890	19,445	15,435	3,150	3,964	590
1. Total tuberculosis (010-018)	200	62	32	73	16	5	5	7
Respiratory tuberculosis (010-012)	155	46	28	55	13	2	4	7
Other forms (013-018)	45	16	4	18	3	3	1	-
2. Septicemia (038)	353	113	66	82	56	7	25	4
3. Acquired immunodeficiency syndrome (042)	5,592	1,831	1,129	1,454	684	142	250	102
4. Other HIV infections (043-044)	197	44	45	75	27	2	3	1
5. Viral hepatitis (070)	56	10	11	23	11	-	1	-
6. Pneumocystosis (136.3)	56	12	2	28	12	2	-	-
7. Other infective and parasitic diseases (Rest of 001-139)	169	46	30	61	16	3	10	3
8. Malignant neoplasms, all (140-208)	15,228	3,017	2,150	4,072	3,615	819	1,500	55
Lip, oral cavity and pharynx (140-149)	266	62	34	70	59	14	23	4
Digestive organs and peritoneum (150-159)	4,318	805	662	1,160	1,084	222	366	19
Stomach (151)	684	124	95	190	185	33	52	5
Colon (153)	1,536	280	222	437	398	82	113	4
Rectum (154)	230	48	50	52	53	13	13	1
Liver, bile duct, gallbladder (155-156)	625	121	94	174	158	28	45	5
Pancreas (157)	788	142	111	212	183	45	94	1
Respiratory system (160-165)	3,729	767	470	1,031	893	237	315	16
Trachea, bronchus and lung (162)	3,517	722	436	967	853	228	296	15
Kaposi's sarcoma (173.9)	18	3	4	4	4	-	3	-
Breast and genito-urinary organs (174, 179-189)	3,942	782	588	1,059	931	202	374	6
Breast, female (174)	1,518	298	211	431	350	75	151	2
Cervix uteri (180)	138	25	21	54	21	2	15	-
Ovary and other uterine adnexa (183)	485	88	58	128	112	32	66	1
Prostate (185)	991	230	175	244	227	46	66	3
Bladder and other urinary organs (188-189)	532	90	79	125	145	35	58	-
Other and unspecified sites (Rest of 140-199)	1,498	314	193	382	351	74	180	4
Lymphatic and hematopoietic tissues (200-208)	1,457	284	199	366	293	70	239	6
Leukemia and aleukemia (204-208)	531	99	58	122	101	31	118	2
9. Benign and unspecified neoplasms (210-239)	182	30	23	49	46	8	26	-
10. Diabetes mellitus (250)	1,055	187	225	343	224	40	30	6
11. Alcohol dependence syndrome (303)	456	107	78	163	65	7	6	30
12. Drug dependence and accidental drug poisoning**	858	170	187	225	119	14	86	57
Drug dependence (304)	803	157	168	215	113	14	83	53
13. Diseases of nervous system (320-389)	518	140	102	128	104	12	30	2
14. Total cardiovascular diseases (390-459)	32,096	5,332	4,981	9,912	8,506	1,673	1,472	220
Cerebrovascular disease (430-438)	2,189	475	347	648	520	92	95	12
Heart diseases (393-398, 402, 404-429)	28,468	4,502	4,367	8,911	7,671	1,524	1,294	199
Chronic rheumatic heart disease (393-398)	97	19	18	22	23	4	11	-
Ischemic heart disease (410-414)	23,456	3,218	3,474	7,426	6,735	1,405	1,077	121
Other forms of heart disease (420-429)	3,454	886	580	1,039	672	86	141	50
Hypertensive disease (401-404)	1,867	473	377	555	324	40	67	31
Atherosclerosis (440)	298	80	49	60	75	15	17	2
15. Pneumonia and influenza (480-487)	2,719	657	496	759	523	142	117	25
16. Chronic obstructive pulmonary diseases, all (490-496)	1,526	342	269	390	363	90	61	11
Bronchitis, emphysema, asthma (490-493)	557	118	105	168	106	29	25	6
17. Ulcer of stomach and duodenum (531-533)	207	46	39	56	52	3	7	4
18. Appendicitis (540-543)	11	4	2	2	2	-	1	-
19. Intestinal obstruction and hernia (550-553, 560)	87	20	14	23	24	2	4	-
20. Chronic liver disease and cirrhosis (571)	990	237	204	273	189	27	43	17
21. Nephritis, nephrotic syndrome and nephrosis (580-589)	327	71	55	106	71	9	14	1
22. Hyperplasia of prostate (600)	7	2	1	1	1	-	2	-
23. Complications of pregnancy, childbirth and the puerperium (630-676)	30	9	3	9	5	2	2	-
24. Congenital anomalies (740-759)	411	75	62	139	55	15	65	-
25. Certain conditions originating in the perinatal period (760-779)	793	94	158	297	159	26	56	3
26. Sudden infant death syndrome (798.0)	114	18	31	35	22	4	4	-
27. Ill-defined (Rest of 780-799)	362	57	84	130	44	11	11	25
28. All other diseases	2,183	534	429	547	430	85	136	22
All External Causes	4,273	759	881	1,243	824	111	265	190
29. Total accidents (E800-E949)	1,486	249	241	426	324	54	127	65
Accidental drug poisoning**	55	13	19	10	6	-	3	4
Motor vehicle accidents (E810-E825)	586	70	101	176	142	26	51	20
Home accidents	471	116	69	144	110	16	7	9
30. Suicide and self inflicted injuries (E950-E959)	605	160	91	160	127	19	30	18
31. Homicide (E960-E975, E990-E999)	2,041	324	529	627	341	35	100	85
32. Injury undetermined whether accidentally or purposely inflicted (E980-E989)	141	26	20	30	32	3	8	22

*Numbers in parentheses are codes of International Classification of Diseases, Ninth Revision.

**Drug dependence is code 304 and accidental drug poisoning includes E850.0, E854.1, E855.2, E858.8.

Note: Rates for 1979-1981 and 1989-1991 are based on deaths to New York City residents only, regardless of place of occurrence, while those for previous years included all events in New York City, regardless of the residence of the decedents. See Technical Notes.

For 1901-1903 and 1909-1911 rates are adjusted for age and sex. For other years, rates are adjusted for age, sex and race (white and others). Standard is United States population, 1940.

* Data are not available or not applicable until a later time period.

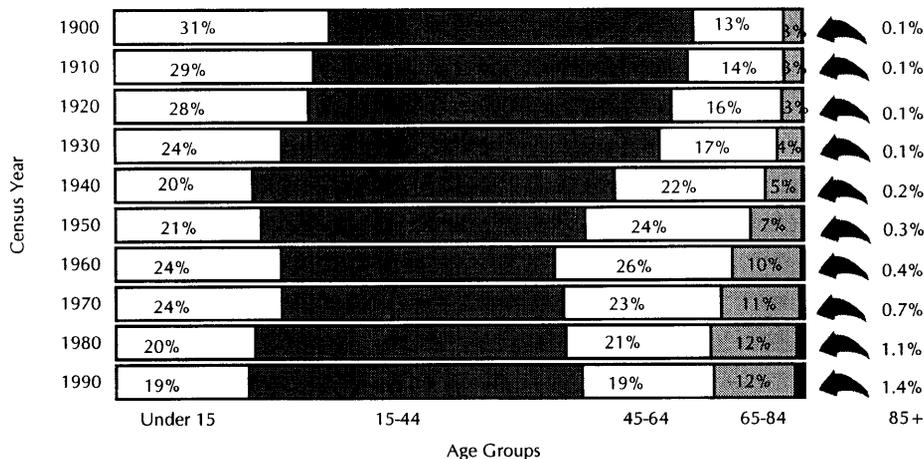

Figure 1. Changes in Age Composition of the Population New York City, 1900-1990

The age composition of the New York City population reflects changes in life expectancy, and natural historic trends. From 1900 to 1990, the proportion of city residents age 45 and over doubled, from 16% to 32%; the increase was greatest in the oldest age group, those 85 & over. The effect of the economic depression of the 1930's on the number of live births is seen in the lower percentage of residents under age 15 in 1940, while the post World War II baby boom increased this segment rapidly after 1950.

Figure 2. Age and Sex Composition of the Population New York City, 1990

This age-sex pyramid shows that there are more females than males in the New York City, 1990 population, and that the excess is greater at the older ages. The smaller segment of both males and females in age group 5-9 years reflect the lower number of births in the early 1980's, compared to the larger number in the second half of the 1980's.

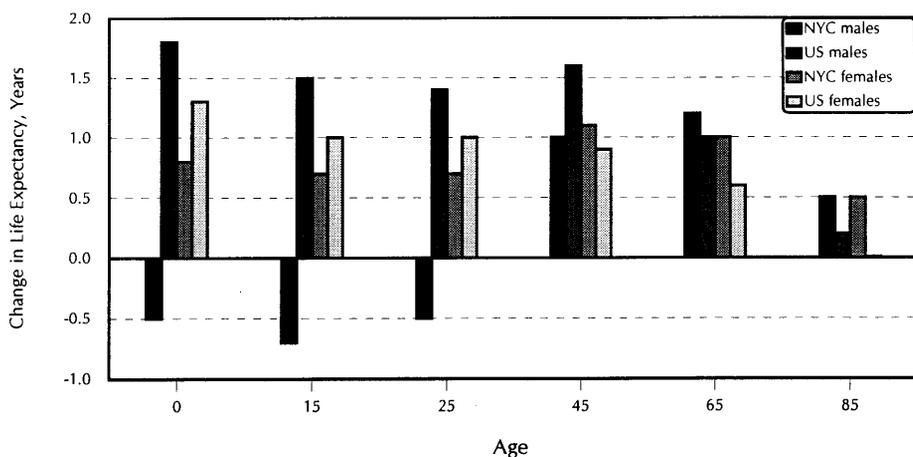

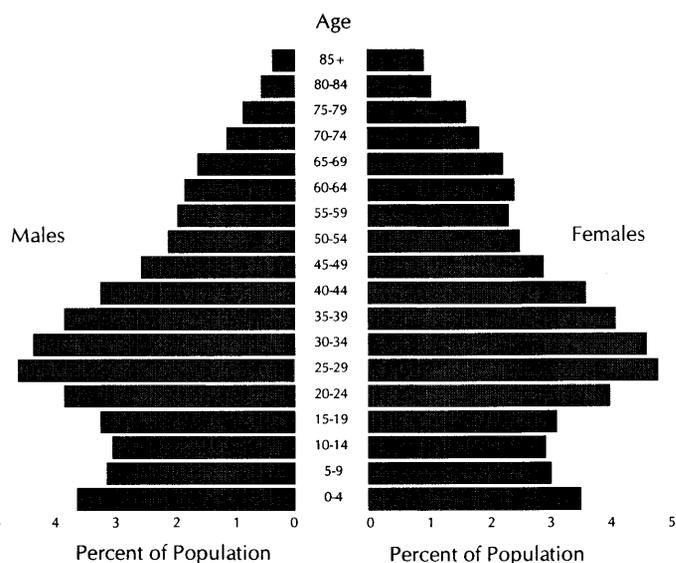

Figure 3. Changes in Life Expectancy at Selected Ages by Sex, 1980 and 1990 New York City and United States

Between 1980 and 1990, life expectancy for male New York City residents at birth, at ages 15 and 25 declined about one half year, while life expectancy for all United States males at these ages increased about one and one half years. Life expectancy for New York City females increased but less than for all United States females. At selected older ages New York City male residents showed somewhat greater increase in life expectancy than did males nationwide. New York City female residents achieved greater gains in life expectancy than did all United States females at these later ages. The decline in life expectancy among New York City males has been attributed to deaths due to AIDS and related infections.

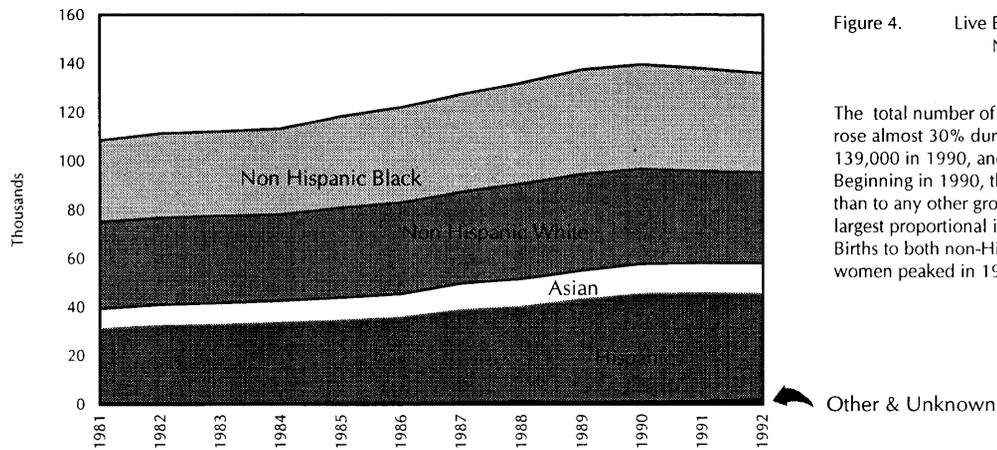

Figure 4. Live Births by Mother's Ethnic Group
New York City, 1981-1992

The total number of live births registered in New York City rose almost 30% during the 1980's from 108,000 in 1981 to 139,000 in 1990, and declined 2.6% in 1992 to 136,000. Beginning in 1990, there were more births to Hispanic women than to any other group. Births to Asian mothers showed the largest proportional increase from 1981 to 1992, almost 50%. Births to both non-Hispanic black and non-Hispanic white women peaked in 1989, and declined slightly thereafter.

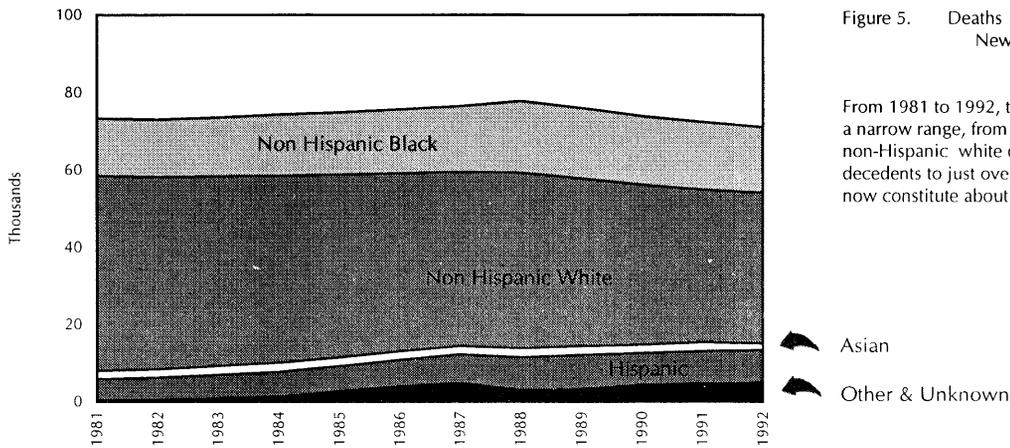

Figure 5. Deaths by Ethnic Group of Decedent
New York City, 1981-1992

From 1981 to 1992, the annual number of deaths varied within a narrow range, from 73,000 to under 78,000. The number of non-Hispanic white decedents declined from two-thirds of all decedents to just over half. Deaths among non-Hispanic blacks now constitute about one-quarter of New York City deaths.

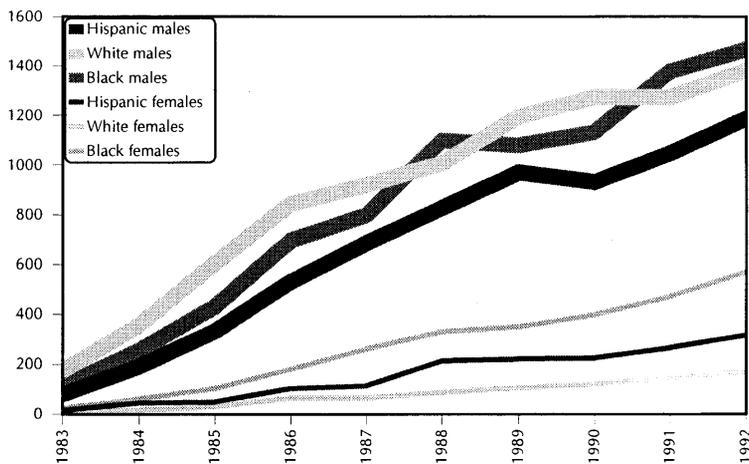

Figure 6. Deaths Due to AIDS by Sex and Selected Ethnic Group
New York City, 1983-1992

Although there continue to be more AIDS deaths among males than among females, the ratio has declined since 1987, from about six-to-one to about four-to-one. Among males, there are now more deaths among non-Hispanic blacks than among non-Hispanic whites. Among females, most AIDS deaths occur among non-Hispanic black women, followed by Hispanic women. In both sexes, there is no apparent levelling of deaths.

Table 17.

Deaths and Death Rates per 100,000 Population from

Cause (ICD-9 Codes ⁽¹⁾)	ANNUAL

** Data are not available or not applicable until a later time period.

(1) Numbers following causes are codes of the International Classification of Diseases, Ninth Revision.

fetal deaths 28 weeks and over + infant deaths under 7 days

(2) Perinatal mortality rate = $\frac{\text{fetal deaths 28 weeks and over} + \text{infant deaths under 7 days}}{\text{live births}} \times 1,000$

(3) Acquired immunodeficiency syndrome (AIDS) was first reported as a cause of death in 1982. From 1982 to 1986, the ICD code was 279.1; beginning 1987 it is code 042.

(4) Rate per 100,000 population under 5 years of age.

(5) Accidental drug poisoning includes ICD codes E850.0, E854.1, E855. 2, E858. 8.

(6) Data for 1982-1985.

(7) Rate less than 0.05.

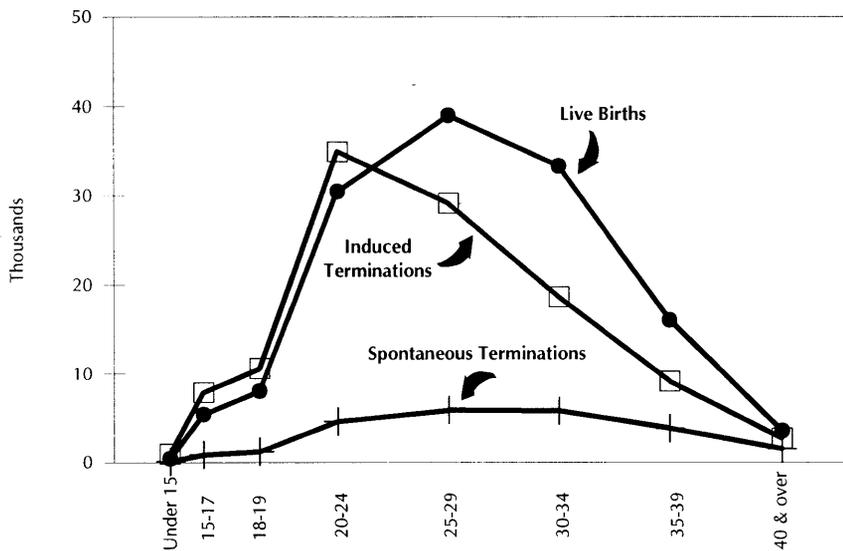

Figure 7. Live Births, Induced Terminations and Spontaneous Terminations of Pregnancy by Age of Woman
New York City, 1992

There are almost 250,000 pregnancy outcomes reported in New York City annually. Over half are live births, about 40% are induced terminations and the remainder are spontaneous terminations, or fetal deaths. (The number of spontaneous terminations reported depends on the level of active surveillance.) For women under age 24, the outcome is more likely to be an induced or spontaneous termination than a live birth. Women age 30-34 and 35-39 are about twice as likely to have a live birth as an induced or spontaneous termination.

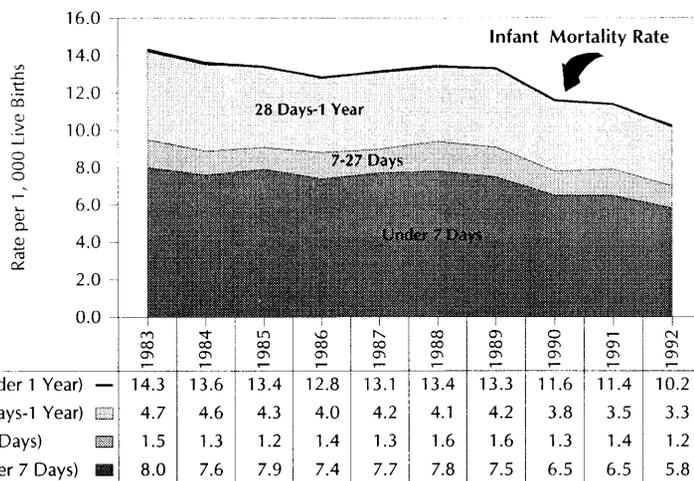

Figure 8. Infant, Neonatal and Post-neonatal Mortality Rates
New York City, 1983-1992

The New York City infant mortality rate has declined 20% since 1983. The largest drop, 13%, occurred from 1989 to 1990. About 55% of infant deaths occur in the early neonatal period, under seven days of age, about 10% in the late neonatal period, 7 to 27 days, and about one-third from 28 days through the remainder of the first year of life. Similar declines have occurred in all three age groups.

(1) Puerto Rican, Other Hispanic and Asian ethnicity are based on ancestry, regardless of race. Those of other ancestries are classified as Other White, Other Black, Other & Unknown, based on race. See Technical Notes.

(2) In the absence of a matching birth certificate for an infant death, the information on the death certificate is used to assign a maternal ethnic group.

(3) Rate per 1,000 live births.

(4) Rate per 10,000 live births.

*Excludes those under 13 years of age. Figures previously published have been revised to include additional reports.

**Excludes intravenous drug users.

TECHNICAL NOTES

VITAL EVENTS - Vital Event data are based on occurrences in New York City to both residents and non-residents. Counts of births, deaths and induced and spontaneous terminations of pregnancy are based on certificates filed with the Bureau of Vital Records, New York City Department of Health. The number of marriages shown in Table 1 is the number of marriage licenses issued by the City Clerk. Tables 14, 15 and 16 use other data sources; see Life Expectancy below. ●For public health purposes, the medical and demographic information on the certificates is coded in general agreement with standards developed by the National Center for Health Statistics (NCHS). In some instances, such as Ancestry of decedent or mother, New York City data are more detailed. ●Legitimacy status does not appear on the certificate, but is inferred from other items.

POPULATION - Population data are census figures provided by the New York City Department of City Planning and the New York State Department of Health. In Table 1, the population figures for census years (1960, 1970, 1980 and 1990) are census counts; for intercensal years straight-line interpolations are used. Rates in this table are based on the population shown, which may be out-dated. ●The corrected data in Table 2a are based on the Bureau of the Census's MARS File (modified for Age, Race and Sex). The primary change is the allocation to a race category of over 900,000 New York City residents of Hispanic ancestry who did not report a race in the Census; the number of New York City residents in the race category Other and Unknown declined from 1,392,964 to 556,918, while the number of whites increased by almost 650,000 and the number of blacks by almost 190,000. There were also some minor corrections in the age and sex distributions.

LIFE EXPECTANCY, AND SPECIFIC AND ADJUSTED DEATH RATES - Life expectancy tables summarize the effect of mortality rates prevailing at a specific time on persons being born or living at that time. Tables may be computed for population subgroups, most often males and females and race groups. The components required are counts and mortality figures for the desired subgroups. Life Expectancy tables are presented for census years, which are when the population data are available. The mortality experience for the census year and for the year before and the year after is used to smooth statistical variation. ●The same two sets of data, population and mortality, are used to prepare average yearly age-sex-specific death rates for the three years (Table 15). Finally, the mortality data are separated into cause groups, and used to calculate average yearly age-sex-race adjusted death rates (Table 16). Adjustment allows comparisons between rates to be made over time or between geographic areas by eliminating the effects of differences in the composition of the populations. ●A change in the data used for the 1980 and 1990 calculations is noted in Tables 15 and 16 by a line separating these rates from those for

earlier years. The calculations for 1980 and 1990 used information on all deaths occurring to New York City residents regardless of place of occurrence (obtained from the New York State Department of Health), whereas previous computations used all deaths occurring in New York City, regardless of residence of the decedent. The new data were also used to recompute 1980 Life Expectancy tables to facilitate comparisons with 1990 figures. ●Life expectancy tables for Hispanics cannot be calculated because of under reporting of Hispanic ancestry on death certificates; technical changes in the death certificate are planned to correct this problem.

RACE, ANCESTRY AND ETHNICITY - Race and Ancestry are separate items on the certificates. Responses are coded in general conformance to rules of NCHS. ●In 1992, five additional codes for Asian and Pacific Islander races were added, following their introduction by NCHS: Asian Indian, Guamanian, Korean, Samoan and Vietnamese. Codes already in use include Chinese, Filipino, Hawaiian, Japanese and Other. ●In certain instances, the item Birthplace is used to remove ambiguity in the Race item. ●Persons whose race is black and whose ancestry is American are classified as being of African-American ancestry. ●Ethnicity (sometimes called Ethnic Group) is determined by applying ordered selection rules to the certificate. First, persons of Puerto Rican, other Hispanic or Asian ancestry are assigned to those respective ethnicities, regardless of race. Then, those of other ancestries are classified by race as Other White, Other Black, Other or Unknown.

CAUSE OF DEATH - Cause of death information presented is the underlying cause of death on each certificate, selected using rules issued by NCHS and codes of the International Classification of Diseases, Ninth Revision, implemented in 1979. Earlier revisions and the year their codes were implemented are the Fifth, 1939; Sixth, 1949; Seventh, 1959; and Eighth, 1969. Long term trends in causes of death should be interpreted with caution because of possible change in causes and groupings with each revision.

External Causes of Death - External causes of death include accident, suicide, homicide and injury undetermined whether accidentally or purposely inflicted. ●The introduction of the category injury undetermined in 1969 affected the number of deaths classified as accidents or suicides; any discussion of trends in these causes should take this change into account. The number of deaths classified as injury undetermined has declined since 1989, but they should be considered in analysis of deaths due to external causes. ●The classification of accident types in Table 8 is based on categories developed by the National Safety Council, which emphasize the site of the accident. However, deaths due to firearms and to accidental drug poisoning are shown separately, regardless of site.

Deaths Due to Drug Abuse - Revised procedures at the Office of Chief Medical Examiner in 1989 led to a substantial portion of deaths related to drug use being classified as

accidental drug poisonings. In prior years, virtually all such deaths were classified as due to drug dependence. In order to maintain continuity with previously published Vital Statistics, three new categories have been added to various tables. "Accidental drug poisoning" is shown in Tables 3, 8 and 17. "Accidents except drug poisoning" appears in Tables 4 and 5. "Drug dependence and accidental drug poisoning" is shown in Tables 3, 4 and 5. Deaths due to accidental drug poisoning are assigned to one of the following four codes of the ICD-9, depending on the agent: E858.0, opiates and related narcotics; E854.1, psychodysleptics; E855.2, local anesthetics; E858.8, other drugs and combinations. Deaths due to drug dependence are assigned to code 304. Since 1989, the number of deaths assigned to accidental drug poisoning has declined; the category "drug dependence and accidental drug poisoning" is the most useful for analysis of trends.

AIDS Mortality - Mortality data for AIDS represent the number of deaths with underlying cause assigned to code 279.1 of the ICD-9 in 1986 and earlier, and to newly created code 042 in 1987 and thereafter. For other deaths due to Human Immunodeficiency Virus (HIV), codes 043 and 044 were also created in 1987. Since New York City has an active AIDS surveillance system, it is possible to compare death certificate data to the surveillance registry. Death certificate information for adult AIDS deaths for 1990 was compared to the New York AIDS Surveillance Registry and 92% were identified as confirmed AIDS cases. Among AIDS cases on the registry who died in 1990, 84% had AIDS as the underlying cause of death. Other underlying causes recorded for these decedents were HIV infection and pneumocystis pneumonia. Death certificates for pediatric (age under 13 years) AIDS cases agreed with the AIDS registry in 80% of cases. Among pediatric AIDS cases on the registry who died in 1990, 75% had AIDS as the underlying cause of death.

Maternal Deaths - Maternal deaths are those with underlying causes assigned to codes 630-679, complications of pregnancy, childbirth and the puerperium (the six-week period following childbirth). These codes are assigned only if death occurs within 42 days of delivery.

BOROUGH OF RESIDENCE - Borough of residence and other geographic classifications are based on the usual residence reported in the certificate. As of 1990 deaths of nursing home residents are assigned to the area where the nursing home is located, as residents of nursing homes are included in census figures. Prior to 1990, these deaths were reported in a separate category, Residents of Institutions.

PLACE OF DEATH - Hospital reported as the Place of Death includes residential units, hospices and other special facilities within the hospital. Nursing Home includes only sites licensed as Extended Care Facilities by the State of New York. Home includes, in addition to private houses and apartments, group quarters for special populations, homes for adults and other long-term residential sites.

Rates and Ratios

The numerators of the rates in these tables are events occurring in New York City and reported during the year, unless otherwise specified. The denominator is the resident population figure from the 1990 census, including all ages and both sexes, unless otherwise specified.

Live Birth Rate - The number of live births per 1,000 population.

$$\frac{\text{Live Births} \times 1,000}{\text{Population}}$$

Marriage Rate - The number of marriages per 1,000 population.

$$\frac{\text{Marriages} \times 1,000}{\text{Population}}$$

Infant Mortality Rate - The number of infant (under one year of age) deaths per 1,000 live births.

$$\frac{\text{Infant Deaths} \times 1,000}{\text{Live Births}}$$

Neonatal Mortality Rate - The number of neonatal (under 28 days) deaths per 1,000 live births.

Post-neonatal Mortality Rate - The number of post-neonatal (28 days to under one year of age) deaths per 1,000 live births.

$$\frac{\text{Fetal deaths 28 weeks and over} \times 1,000}{\text{Live Births}}$$

Fetal Death Ratio - The number of fetal deaths of 28 weeks gestation and over per 1,000 live births.

Perinatal Mortality Rate - The number of fetal deaths of 28 weeks gestation and over plus the number of early neonatal (under seven days) deaths per 1,000 fetal deaths of 28 weeks gestation and over plus live births.

$$\frac{(\text{Fetal deaths 28 weeks and over} + \text{Infant deaths under 7 days}) \times 1,000}{\text{Fetal deaths 28 weeks and over} + \text{Live Births}}$$

Death Rate, all causes - The number of deaths per 1,000 population.

$$\frac{\text{Deaths all causes} \times 1,000}{\text{Population}}$$

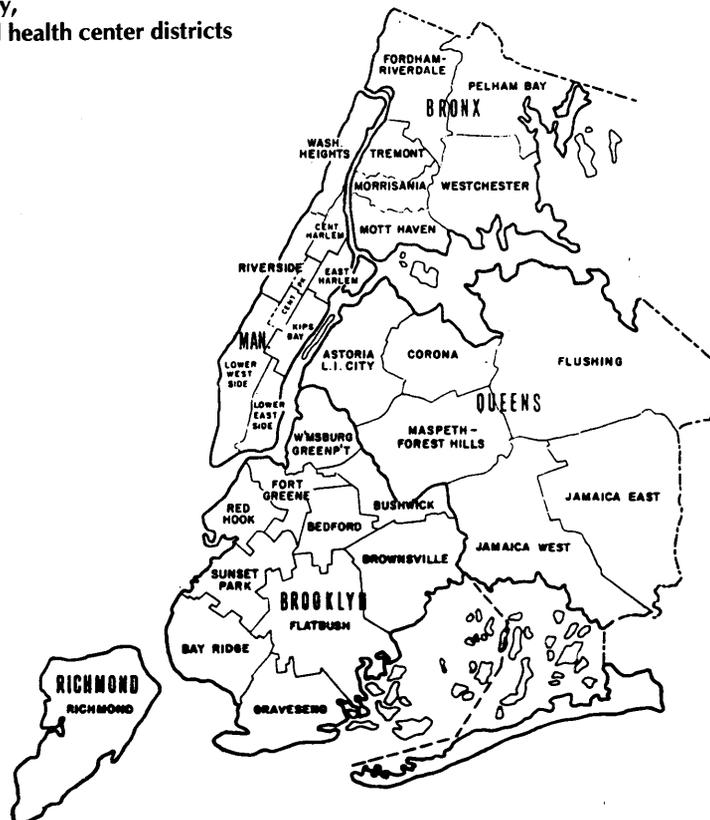

Death Rate, specified causes - The number of deaths due to a specified cause per 100,000 population.

Death Rate, age and sex specific - The number of deaths of persons of specified age and sex per 1,000 population of the specified age and sex.

Death Rate, age, sex and race adjusted - The number of deaths per 100,000 standard population. Age, sex and race specific death rates are applied to a standard population, eliminating the effect of differences in population composition, and allowing comparisons over time or between geographic areas.

Maternal Mortality Rate - The number of deaths due to complications of pregnancy, childbirth and puerperium occurring within 42 days of delivery per 10,000 live births.

Figure 11. New York City, boroughs and health center districts

HIGHLIGHTS

The 1992 New York City Vital Statistics Summary contains features recently added or expanded, designed to make the publication more useful.

POPULATION AND LIFE EXPECTANCY - Table 2a contains population figures from the 1990 census, corrected by the Bureau of the Census for certain under reporting. Counts for five-year age groups by sex and race are shown; separate counts are also given for Hispanic males and females, who may be of any race. New figures illustrate other aspects of census data: Figure 1 shows the age composition of the population from 1900 to 1990, while Figure 2 displays the age-sex composition of the 1990 population as a population pyramid.

Table 14 shows life expectancy for New York City and United States residents for 1980 and 1990 from birth to 85 years of age. The New York City resident mortality data have been improved from those used in previous years by including deaths occurring to City residents outside the City (obtained from the New York State Department of Health) and excluding deaths to nonresidents. Figure 3 compares changes in life expectancy at selected ages between New Yorkers and all United States residents.

Tables 15 and 16 have been updated using improved 1980 and 1990 mortality data. Table 15 contains decennial age-sex specific death rates and Table 16 shows age-sex-race adjusted death rates for selected causes.

Detailed discussions of the data can be found in the table footnotes and in the Technical Notes.

FIGURES - New figures illustrate other aspects of New York City's vital events. Figures 4 and 5, respectively, show the ethnicity of women delivering infants and of persons dying. Figure 6 shows sex and ethnicity of persons dying of AIDS from 1983 through 1991. Figure 7 shows the age characteristics of women experiencing differing birth outcomes in 1991, and Figure 8 displays age at death for infants from 1983 through 1991.

Figure 9 presents the average number of marriages, births and deaths each day, a snapshot of vital events in the City in tabular format. The most popular names for New York City-born infants, as well as some historic perspective, are given in Figure 10.

CAUSE OF DEATH - Table 17, which presents historic data on cause of death, now contains specific information on deaths due to malignant neoplasms of trachea, bronchus and lung among both males and females, and to breast cancer among females.

TECHNICAL NOTES AND DEFINITIONS - The Technical Notes have been greatly expanded, and should be read by every user of this Summary. Definitions that will assist in understanding the data are presented, as are some limitations of the data.
